Son empleados para Fundición y aleaciones ligeras en acero

## Cortador de Alto Avance

- Son empleados para Fundición y aleaciones ligeras en acero
- De rápido cambio para la reducción de tiempo en cambio de cuchillas
- Filo de Corte exelente
- Rápida cambio para el tamaño de corte en  $\varnothing 160$ , dos tipos de piezas para el tamaño de cortador  $\varnothing 200$

### Guía de Ajuste del inserto

- El equipo especial tiene que ser utilizado para el funcionamiento exacto con el alto cortador de la alimentación

| Adaptador tipo   | Roller tipo  | Plate tipo  |
|--|--|---|
|   |   |    |
| <ul style="list-style-type: none"> <li>- Principalmente debajo de <math>\varnothing 160</math> el diámetro se utiliza en tipo de 1 pedazo</li> <li>- Disponible para de tamaño fijo del cortador y de la junta y de la comprobación puede ser hecho al mismo tiempo</li> </ul> | <ul style="list-style-type: none"> <li>- Principalmente sobre <math>\varnothing 200</math> el diámetro se utiliza en el tipo 2piece</li> <li>- Debido al rodillo de guía ajustable 3, tamaño de la variedad de cortador puede ser montado</li> </ul> | <ul style="list-style-type: none"> <li>- Conveniente para el cortador tamaño pequeño debido al tructure simple</li> <li>- Es innecesario unclamp el cortador de la máquina, él es posible volver a montar el cortador como él montón en la máquina</li> </ul> |

### Guía del ajuste del Inserto en adaptador/ rodillo

- 1 Limpie el cortador y el equipo.
- 2 El indicador se debe montar con la misma altura con el cortador.
- 3 Muvase a cada parte movable en asiento de la extremidad al extremo del indicador y apriete (cua del esfuerzo de torsin 2N.m).
- 4 Intercambie el indicador para marcar el calibrador.
- 5 Measure el agotamiento totalmente.
- 6 Cuando un parte movable sobre agotamiento, afloja la cua y ajusta agotamiento. (para el desbaste 10~20 $\mu$ , para el acabamiento 5~10 $\mu$ )
- 7 Apriete (cua del esfuerzo de torsin 7-8N.m).
- 8 Mida el agotamiento final por el calibrador del dial.

- Nota)** - Cuando usted afianza la cuña con abrazadera también apriete, agotamiento está consiguiendo peor a la distorsión del cortador  
 - Cuando usted afianza la cuña con abrazadera, usted debe utilizar la llave de esfuerzo de torsión para fijar más exacto.

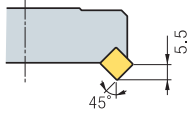

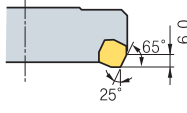

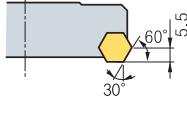

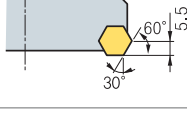

### Sistema de anclaje ( $\varnothing 200 \sim \varnothing 450$ )

# E Información técnica Cube Mill

## Cortador Korloy especial para el desbaste en fundición

# Cube Mill

- KORLOY Cortador especial para el desbaste de fundición
- 8 esquina de filo del inserto (16 filos disponible con 2 cortadores, cortador Der/Izq)
- Funcionamiento excelente de corte debido al ángulo de incidencia positivo hecho por el rompeviruta 3dimensional
- Vida excelente de la herramienta por la combinación de variedad de grados y de rompevirutas según condiciones de trabajo
- 2 tipos diferentes de insertos (Chaflán / Radio) y pueden ser montados en el mismo cortador

Desbaste en Fundición

Ideal combinación de cuerpo de aluminio con hierro fundido

# Couple Mill

- Ideal combinación de cuerpo de aluminio con hierro fundido
- Puesto que el peso del cortador se ha reducido hasta el 50% en comparación al cortador de acero, es muy fácil de manejar
- Aplicable para Cube mill y Storm mill

La variedad de grados garantiza una excelente vida de la herramienta

# Storm Mill

- Cortador convencional de amplia cobertura
- Utiliza los 4 filos del inserto (Maximo 8 filos disponibles para cortador Der/lzq)
- Efectivo para cortes de gran profundidad
- La variedad de grados garantiza una excelente vida de la herramienta.
- 2 diferentes tipos de insertos (Chaflán / Punta R) para un mismo cortador

# E Información técnica Shave Mill

Fresa óptima para mecanizado de acero y fundición con fácil ajuste de la excentricidad

## Shave Mill

- Rango ajustable (Rango ajustable: 0.1 mm, Margen admisible ajustable: hasta 2  $\mu\text{m}$ )
- Placa de 8 esquinas tipo corona Wiper que reduce el coste de mecanizado y proporciona una excelente rugosidad superficial
- Calidad con alta tenacidad y resistencia al desgaste que asegura una larga vida útil de la herramienta
- La calidad cBN logra un acabado superficial superior

**Ejemplo de aplicación**

- **Pieza Trabajo** Cabeza de cilindro (refrentado)
  - **Condiciones de corte** vc = 200, fz = 0.15, ap = 0.5, En seco
  - **Herramientas** Shave Mill SVMM4250R  
Placa PC6510 SNEU120420-MF
- 
- **Pieza Trabajo** FC25(HB250) Cabeza de cilindro (refrentado)
  - **Condiciones de corte** vc = 700, fz = 0.1, ap = 0.5, Dry
  - **Herramientas** Shave Mill SVMM4160R  
Placa DBN920 SNEU1204-cBN

• Resultados

|                    | Vida útil de la herramienta | Acabado superficial | Capacidad de maquina |
|--------------------|-----------------------------|---------------------|----------------------|
| <b>Shave Mill</b>  | 250 pcs                     | Rz = 3µ             | Alto                 |
| <b>Competencia</b> | 180 pcs                     | Rz = 3.5µ           | Normal               |

• Las fresas de cepillar KORLOY garantizan el doble de mecanizabilidad, adaptabilidad y rugosidad superficial que sus competidores, así como el doble de vida útil de la herramienta.

# E Información técnica Shave Mill-Ultra

La vida mejor de herramienta con especial Grado que tiene tanto la dureza y resistencia al desgaste

## Shave Mill-Ultra

- Excelente aspereza superficial para este cortador de acabado cuando aplica a trabajo de pieza pesada
- Fácil de manejar y buena rigidez con el sistema de tornillo simple
- Buena superficie de acabado debido al filo de corte de wiper crown
- La vida larga de herramienta gracias al grado especial que tiene dureza y resistencia al desgaste
- Dos tipos diferentes: Tipo económico y normal y Tipo 'B' que tiene Run-out ajustable

### ➤ Sistema Codificación

### ➤ Sistema Codificación para Insertos

### ➤ Características

**Tipo normal**

Buena rigidez y economica debido a tornillo en el tipo simple.

Mejor rugosidad de la superficie cuando se utiliza sólo una inserción, pero modifica la áp' en virtud de 0.03 mm

**Filo de Corte Ajustable (Tipo B)**

Fácil de manejar el periodo previo a cabo debido a la dureza KORLOY exclusiva de corte de alta pieza del borde especiales

Buen rendimiento de corte y flujo de la viruta debido al rompevirutas positivo ángulo de inclinación

Inserto económico de 4 filos

Excelente rugosidad de la superficie debido al filo wiper crown de vanguardia

**Rango de ajuste**

- Rango: 1.0 mm
- Previsión: En 2 μ

### ➤ Condiciones de corte recomendadas

| Pieza Trabajo | Condicion de Corte |                |         | Externo | Calidades |
|---------------|--------------------|----------------|---------|---------|-----------|
|               | vc (m/min)         | fz (mm/diente) | ap (mm) |         |           |
| P             | 160~270            | 0.05~0.20      | ~0.50   | Tam use | PC3700    |
|               | 160~270            | 2~5            | ~0.03   | 1use    |           |
| K             | 140~230            | 0.05~0.20      | ~0.50   | Tam use | PC6510    |
|               | 140~230            | 2~5            | ~0.03   | 1use    |           |

# Aplicaciones Herramientas para Engranajes

## Ej. de Aplicación Externa

### Acabado: M20

- **Diam. Cortador:**  $\varnothing 400$
- **No Dientes:** 20
- **Engrane Externo:**  
Cortador de acabado para el procesamiento de engranes que cuenta con un nivel de precisión KS 4
- Cortador que simultáneamente realiza Chafflánes cuando esta en operación

M20XZ130-EX

### Semi-Acabado

- **Diam. Cortador:**  $\varnothing 280$
- **No Dientes:** 48
- Diseñado para el proceso de engranes externos con espiral.
- Se puede trabajar desde la raíz del engranaje con insertos tipo R optimos

M20-M22-ROU

### Desbaste

- **Diam. Cortador:**  $\varnothing 300$
- **No Dientes:** 60
- Alto rango de avance con Baja resistencia de corte debido al diseño en V al montar los insertos

LNE333-02-1

LNE434-02-1

KEL1906-C0.6-MF

## Ej. de Aplicación Interna

### Acabado: M16

- **Diam. Cortador:**  $\varnothing 400$
- **No Dientes:** 20
- **Engrane Interno:**  
Cortador de acabado para el procesamiento de engranes que cuenta con un nivel de precisión KS 4
- Cortador que simultáneamente realiza Chafflánes cuando esta en operación

M16XZ130

### Semi-Acabado

- **Diam. Cortador:**  $\varnothing 280$
- **No Dientes:** 48Tooth
- El cortador de semi-acabado ha sido diseñado para la transformación de la forma externa del engranaje a una forma curvilínea.

M16-M18-ROU

LNE433-R60

### Desbaste

- **Diam. Cortador:**  $\varnothing 560$
- **No Dientes:** 40Tooth
- Puede utilizarse para el proceso de engranes debido al diseño óptimo y al tipo de inserto

KEL1906-C0.6-MF

LNE434-02-1

## Ej. Maquinado y Operación

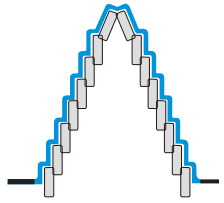

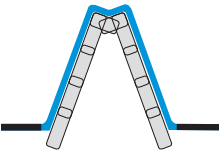

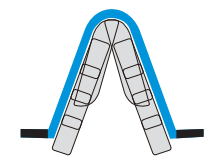

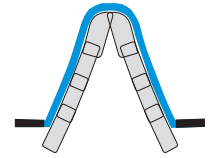

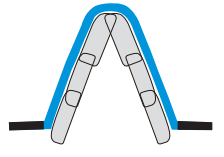

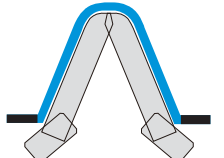

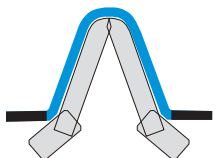

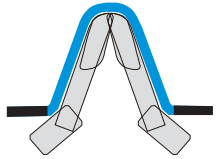

- **Maquina**  
Gleason - PFAUTER Maquina CNC para Hobs  
(Power: 52 kW)
- **Condición de Corte**  
vc = 119.98 m/min (n = 86.8 rpm)  
fz = 0.518 mm/diente (vf = 450 mm/min)  
ae = 36 mm  
Sin refrigerante
- **Herramienta**  
M16-PT-RACK-KOR03 ( $\varnothing 440 \times W90$ )
- **Cortador para Semi-Acabado (baja carga, baja resistencia)**

- **Maquina**  
KARATS (30 kw)
- **Condición de Corte**  
vc = 150 m/min, n = 119 rpm  
fz = 0.09 mm/diente, vf = 81.6 mm/min  
ae = 45 mm  
Sin refrigerante
- **Herramienta**  
Cortador M24 Externo para Semi-Acabado Insertos Utilizados  
M40-ROU (Main),  
CPE424-01 (Flank)

- F123 Formato Pedido Fresas Enterizas Especiales

# F Sistema Codificación

**1 Series**  
Z B E 2 040 - 050 - R T - V N S

Z, IP, ZP: Fresa enteriza para uso general    SSEA, AP: Fresas integrales para aluminio  
 P: Fresa enteriza para alta dureza y alta velocidad    SP: Fresas integrales para acero inoxidable  
 C: Fresa enteriza para cobre y aleaciones de cobre    CC: Fresas integrales para materiales compuestos  
 D: Fresa enteriza para grafito y materiales no ferrosos    T: Fresas integrales para materiales para implantes  
 V: Fresa frontal variable  
 FM: Fresa enteriza de alto avance

**5 Diametro de Corte**  
Z B E 2 040 - 050 - R T - V N S

| Notación | ØD (mm) |
|----------|---------|
| 040      | Ø4.0    |
| 060      | Ø6.0    |
| 080      | Ø8.0    |
| 100      | Ø10.0   |

**2 Tipo**

Fresa enteriza para mecanizado de alta velocidad para acero endurecido

# H Endmill **new**

- Para mecanizar acero endurecido y con tratamiento térmico bajo HRC70
- Nueva tecnología de recubrimiento mejora la resistencia al desgaste
- Un nuevo diseño mejora la maquinabilidad
- Mecanizado de alta velocidad y alta precisión disponible

## Características

- Nuevo grado (PC303S, PC310U)
  - El sustrato ultra fino y el revestimiento AlTiSiN garantizan una excelente resistencia al desgaste
- Tratamiento especial en el filo
  - se utilizó un diseño especial de arista corte especial para reducir el astillado y prolongar la vida útil de la herramienta
- Alta precisión con tolerancia h5 - El sistema de producción de alta calidad permite la tolerancia-h5 en todo el lote

## PBE (Esférico)

- La forma S del filo radial dispersa las cargas de corte
- La tolerancia de la medida R es inferior a  $\pm 0.005\text{mm}$

## PRE (Radio)

- La nueva forma del radio R reduce las cargas de corte
- La tolerancia del vértice R es inferior a  $\pm 0,005\text{mm}$

## Evaluación del desempeño

- **Pieza de trabajo** STD11 (HRC60)
- **Condiciones de corte**
  - Diámetro =  $\varnothing 8.0$ ,  $n$  ( $\text{min}^{-1}$ ) = 4,000
  - $vc$  (m/min) = 100,  $vf$  (mm/min) = 800
  - $fz$  (mm/t) = 0.05,  $ap$  (mm) = 8.0
  - $ae$  (mm) = 0.25, seco
- **Herramientas** PRE4080-100-R05

\* El diseño especial del filo reduce las cargas de corte y prolonga la vida útil de la herramienta

### Consejo aplicación

- Relación entre profundidad axial (ap) y radial (ae)
  - ap = 0.1D
  - ae = 0.03D

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

**Consejo aplicación**

- ap = 0.02D
- pf = 0.05D

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

**Condiciones de corte según voladizo**

- Condiciones de corte en caso de ser sujetado con alto voladizo
  - Cuando el saliente incrementa en 1D, disminuya R.P.M y avance un 10%
- En el caso del tipo recto, ajustar las condiciones de acuerdo con el saliente
  - Ejemplo: cuando el voladizo es 3D y se incrementa en 1D, disminuye R.P.M y avance 10%

**Fórmulas de corte (para fresas radiales)**

- Fórmula velocidad de corte efectiva =  $(\pi \times \text{Deff} \times n)/1000$  (n = min<sup>-1</sup>)
- Fórmula diámetro efectivo =  $(2\sqrt{ap(D-ap)} \times \alpha)$   
D = Ø (diámetro de herramienta), Deff = diámetro efectivo
- Velocidad de corte: cuando el ángulo de pendiente es 0° =  $(\pi \times \text{Deff} \times n)/1000$   
Deff = Eficiencia del diámetro, Calculo de Deff si es ap con varias fresas enterizas esféricas

|          |                             |
|----------|-----------------------------|
| α: α = 1 | Ángulo de pendiente θ = 0°  |
| α = 1.2  | Ángulo de pendiente θ = 7°  |
| α = 1.5  | Ángulo de pendiente θ = 15° |
| α = 1.7  | Ángulo de pendiente θ = 30° |
| α = 2.17 | Ángulo de pendiente θ = 45° |
| α = 2.3  | Ángulo de pendiente θ = 60° |

**Fórmulas velocidad de corte (fresa radial; ángulo de pendiente = 0°)**

- Ej) Diámetro: 6 mm, ap = 0.3 mm, Deff = 2.6 mm, N = 14,000 (min<sup>-1</sup>)  
 Ángulo de pendiente 0°: Veff = 113.7 (m/min)  
 Ángulo de pendiente 15°: Veff = 113.7 x 1.5 = 170.6 (m/min)

**Alerta**

- Las condiciones de corte dependen de la condición de la máquina y la forma de corte
- Use un fluido de corte que sea apropiado para la pieza de trabajo y que produzca pocas reacciones a la temperatura

# F Información Técnica para V Endmill

Productividad mejorada con un mecanizado efectivo debido a menor vibración

## V Endmill

### Variable Endmill

- Ángulo de hélice irregular
- Ángulo divisor irregular

\* Espaciado irregular entre los canales; reduce la vibración al posicionar los filos de corte en ángulos variables

### Características

- 30% más de velocidad de corte (vc) y velocidad de avance (vf) para aumentar la productividad
- Mecanizado de alta calidad disponible gracias a la disminución de vibración y al excelente acabado superficial

### Rendimiento (prueba de vibración)

- **Pieza de trabajo** SCM440
- **Condición de corte** D = Ø8.0, n (m/min) = 3183, vc (m/min) = 80, vf (mm/min) = 713, fz (mm/t) = 0.055, ap (mm) = 8.0, ae (mm) = 8, seco
- **Herramientas** V Endmill VFE4080-060, Fresa enteriza convencional

### Desempeño (Acabado superficie)

- **Pieza de trabajo** STS304
- **Condición de corte** D = Ø8.0, n (min<sup>-1</sup>) = 3979, vc (m/min) = 100, vf (mm/min) = 796, fz (mm/t) = 0.05, ap (mm) = 12, ae (mm) = 0.8, seco
- **Herramientas** VFE4080-060

## Endmill para corte general

# Z Endmill **new**

- Fresa enteriza para corte general de varias piezas de trabajo, dureza inferior a HRC45 (acero al carbono, acero de aleación, fundición, aceros de cementación, etc.)
- Nueva geometría y recubrimiento mejoran el rendimiento y la vida útil de la herramienta
- Diseño optimizado de la cuchilla para menos astillado y mecanizado estable

### Características

- Nuevo grado (PC315E) - El sustrato fino y el recubrimiento lubricante garantizan un excelente rendimiento a alta velocidad y alta temperatura
- Tratamiento especial del filo: se aplicó un diseño especial para reducir el astillado y prolongar la vida útil de la herramienta
- Alta precisión con tolerancia-h5 - Sistema de producción de alta calidad que permite tolerancia-h5 en toda la serie

después de tratamiento especial en el filo

antes

### ZFE (Plano)

$\alpha_1 \neq \alpha_2$ ,  $\beta_1 \neq \beta_2$  Paso y hélice irregular

- Paso y hélice irregular & Paso y hélice irregular reducen el golpeteo y mejoran la superficie

### ZBE (Esférico)

- La geometría S en la esfera dispersa la carga de corte
- La tolerancia de la medida de R es menor a  $\pm 0.005$  mm

### Ejemplos de aplicación

- **Pieza de trabajo** Acero al carbono (SM45C, ~ HRC20)
- **Condición de corte**  $D = \varnothing 8.0$ ,  $n$  ( $\text{min}^{-1}$ ) = 7,165,  $vc$  ( $\text{m}/\text{min}$ ) = 180,  $vf$  ( $\text{mm}/\text{min}$ ) = 1.433,  $fz$  ( $\text{mm}/\text{t}$ ) = 0.05,  $ap$  ( $\text{mm}$ ) = 8,  $ae$  ( $\text{mm}$ ) = 0.8, seco
- **Herramientas** ZFE4080-070

### Consejo aplicación

■ Profundidad ranurado

- $D \leq \varnothing 3$  ( $ap = 0.2D$ )
- $D > \varnothing 3$  ( $ap = 0.5D$ )

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

## ➤ Condiciones de corte recomendadas (ZFE4000/ZSFE4000 Plano)

### Consejo aplicación

■ Profundidad axial (ap) y profundidad radial (ae)

- $ap = 1.0D$
- $ae = 0.05D$

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

## Condiciones de corte recomendadas (ZBE2000 esférico)

| Pieza de trabajo<br>Condiciones | Acero aleado y al carbono<br>(por debajo de HRC30) |                    | Acero pre-endurecido<br>(HRC30~45) |                    |
|---------------------------------|--|--------------------|------------------------------------|--------------------|
|                                 | R.P.M n (min <sup>-1</sup> )                       | Avance vf (mm/min) | R.P.M n (min <sup>-1</sup> )       | Avance vf (mm/min) |
| Diámetro (Ø)                    |  |                    |                                    |                    |
| 1                               | 30,000   | 2,880              | 30,000                             | 2,520              |
| 1.2                             | 30,000   | 3,060              | 28,800                             | 2,580              |

| 12                              | 4,170  | 1,770              | 4,008                              | 1,500              |

### Consejo aplicación

- $ap = 0.03D$
- $pf = 0.05D$

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

## Condiciones de corte según voladizo

- Condiciones de corte en caso de ser sujetado con alto voladizo
  - Cuando el saliente incrementa en 1D, disminuya R.P.M y avance un 10%
- En el caso del tipo recto, ajustar las condiciones de acuerdo con el saliente
  - Ejemplo: cuando el voladizo es 3D y se incrementa en 1D, disminuye R.P.M y avance 10%

## Alerta

- Las condiciones de corte dependen de la condición de la máquina y la forma de corte
- Use un fluido de corte que sea apropiado para la pieza de trabajo y que produzca pocas reacciones a la temperatura

# F Información Técnica para F Endmill

Alta eficiencia y mecanizado de alto avance

## F Endmill

### Fresa enteriza de alto avance

- Productividad mejorada y tiempo de trabajo reducido gracias a la alta capacidad de avance
- El diseño de la fresa permite reducir el costo de producción al incrementar la velocidad de avance.

#### Característica

- Área de desahogo de virutas más operación altamente eficiente
- Mecanizado de alto avance posible mediante la dispersión de las fuerzas de corte

#### Aplicación por pieza de trabajo

#### Ejemplo de productividad

| Tipo                           | Velocidad (vc) | Avance (fz) | D.O.C |     | el volumen de mecanizado (mm <sup>3</sup> /min) |
|--------------------------------|----------------|-------------|-------|-----|---|
|                                |                |             | ap    | ae  |   |
| <b>F-Endmill (alto avance)</b> | 180            | 0.30        | 0.5   | 5.0 | 135,000   |

Fresa entera para el mecanizado de prótesis dentales

T Endmill **new**

- Para el mecanizado de prótesis dentales de zirconia, titanio, Co-Cr, cera, PMMA, etc
- Rendimiento de corte optimizado haciendo coincidir un grado apropiado con cada tipo de material
- Reducción de desigualdad y excelente acabado en superficies mecanizadas debido al diseño optimizado del filo de corte
- Forma de herramienta especializada para cada tipo de máquina

➤ Sistema de codificación

➤ Características

- Una herramienta específica para cada máquina - Cumple con las demandas del mercado
- Un grado especializado para cada pieza de trabajo - proporciona un rendimiento optimizado para varios materiales de implantes
- Diseño optimizado de última generación - permite una maquinabilidad excelente

Forma de corte tangencial

- Rectificado de pasada única
- Desigualdad reducida y excelente acabado en superficies mecanizadas

Forma esférica ajustada al centro

- La forma balanceada al centro asegura ángulo de desprendimiento en el punto central
- Los filos de corte de la forma curva proporcionan una excelente resistencia al desgaste y rendimiento de corte

➤ Solución de grado para zirconia

- **Desarrollo de ND3000 (grado recubierto de diamante)**
  - Recubrimiento de diamante de alta dureza que es excelente en el mecanizado de grafito y cerámica
  - Optimizado para alta velocidad y corte de trabajo medio gracias a su excelente adhesión a las capas de recubrimiento

Superficie de ND3000  
Revestimiento de diamante de alta dureza (Hv 10,000) proporciona excelente resistencia al desgaste

Sección en corte de capas de recubrimiento  
grado especializado para Zirconia proporciona una excelente adhesión

➤ Solución de grado para titanio

- **Desarrollo de PC2510 (Grado recubierto para acero endurecido)**
  - Se aplicó tratamiento de post-recubrimiento para mejorar el acabado superficial
  - Una calidad optimizada para el mecanizado interrumpido de aceros de alta dureza y tratamiento en ambiente húmedo que va acompañado de un alto choque térmico. Sus características de sustrato ultrafino de alta tenacidad permite un rendimiento estable

Resistencia al desgaste mejorada  
grado ultra fino

grado fino

Acabado de superficie mejorado  
Tratamiento post recubrimiento

Recubrimiento convencional

# F Información Técnica para T Endmill

## Evaluación del desempeño

- **Pieza de trabajo** Co-Cr
- **Condición de corte**
  - vc (m/min) = 150
  - fz (mm/t) = 0.08
  - ap (mm) = 0.13
  - ae (mm) = 0.7, Refrigerante
- **Herramientas** TTBE2030-050

### Resultado de la prueba

Excelente resistencia a la tenacidad y al desgaste gracias al nuevo grado PC2510.

## Ejemplos de aplicación

- **Uso** Implantes de muelas
- **Pieza de trabajo** Zirconia
- **Condición de corte**
  - vc (m/min) = 140
  - fz (mm/t) = 0.05
  - ae (mm) = 0.6, seco
- **Herramientas** TZBE2020-044-N200S03 (DOF)

### Resultado de la prueba

## Condiciones de corte recomendadas (Titanio y Co-Cr)

| Diámetro (Ø) | Aplicación | ap (mm) | ae (mm) | n (min <sup>-1</sup> ) | vf (mm/min) |
|--------------|------------|---------|---------|------------------------|-------------|

| Diámetro (Ø) | Aplicación | ap (mm) | ae (mm) | n (min <sup>-1</sup> ) | vf (mm/min) |
|--------------|------------|---------|---------|------------------------|-------------|
| 3.0          | Desbaste   | 0.5     | 1.5     | 23,500                 | 1,600       |
| 2.5          | Medio      | 0.3     | 1.25    | 28,000                 | 1,200       |
| 2.0          | Acabado    | 0.3     | 1.0     | 35,000                 | 1,200       |
| 1.0          | Acabado    | 0.1     | 0.2     | 38,500                 | 1,050       |
| 0.6          | Acabado    | 0.1     | 0.2     | 63,500                 | 630         |

## Formato para orden especial de T Endmill

- Se pueden hacer anillos de parada y otros recursos de herramienta a pedido

### [ Ficha de datos ]

|                                    |  |
|------------------------------------|--|
| Tipo de máquina                    |  |
| Pieza de trabajo                   |  |
| Material dental                    |  |
| Diámetro de corte (D1)             |  |
| Diámetro del mango (D2)            |  |
| Longitud de corte (L1)             |  |
| Longitud del cuello (L2)           |  |
| Posición del anillo de parada (L3) |  |
| Largo tota (L4)                    |  |
| Forma del anillo de parada         |  |

\* Si realiza un pedido especial, complete este formulario y envíelo a la oficina de ventas de KORLOY más cercana

### [ Especificación del anillo de parada ]

< Anillo plástico >

< Anillo tipo E >

(mm)

| Tipo            | Anillo de parada |      |      | Diámetro del Mango |    |    |
|-----------------|------------------|------|------|--------------------|----|----|
|                 | ØD_o             | ØD_i | t    | Ø3                 | Ø4 | Ø6 |
| Anillo plástico | Ø7.55            | Ø3   | 4.45 | ●                  |    |    |
|                 | Ø7.7             | Ø4   | 5.0  |                    | ●  |    |
|                 | Ø10.5            | Ø6   | 6.5  |                    |    | ●  |
| Anillo tipo E   | Ø6.0             | Ø2.5 | 0.4  | ●                  |    |    |

\* Se puede hacer que anillos de parada a pedido si los tamaños especificados se envían a una oficina de ventas KORLOY más cercana

# F Información Técnica para D Endmill

## Fresa enteriza revestido de diamante

# D Endmill new

- Geometrías tangenciales de las aristas de corte para un excelente acabado superficial
- Excelente resistencia al desgaste debido a la alta dureza y recubrimiento de diamante de alta pureza
- Acabado superficial avanzado y rendimiento de corte gracias a los bordes afilados y las geometría tangencial

### Características

#### Geometría de filos tangencial

- Sistema de rectificado de un solo paso
- Evita pasadas escalonadas en la superficie maquinada
- Herramientas de 2 flautas y 4 flautas con punta esférica

#### Forma esférica convergente al centro (4 flautas)

- Forma de punta esférica para mecanizado de alto avance
- Mejora de la rigidez y excelente acabado superficial

### Ejemplos de aplicación

- **Pieza de trabajo** Molde de grafito
- **Condiciones de corte**
  - vc (m/min) = 100
  - fz (mm/t) = 0.11
  - ap (mm) = 0.26, seco
- **Herramientas** DBE4060-110-N250S06

#### Resultado de la prueba

20% mayor vida útil

- **Pieza de trabajo** Molde de grafito
- **Condiciones de corte**
  - vc (m/min) = 180
  - fz (mm/t) = 0.1
  - ap (mm) = 0.2, seco
- **Herramientas** DBE2060-110-N250S06

#### Resultado de la prueba

25% mayor vida útil

- **Pieza de trabajo** Molde de grafito
- **Condiciones de corte**
  - vc (m/min) = 300
  - fz (mm/t) = 0.1
  - ap (mm) = 0.15, seco
- **Herramientas** DBE2060-080-N250S06

#### Resultado de la prueba

25% mayor vida útil

**Condiciones de corte recomendadas (Plano)**

| 8                | 8,000                           | 930                   | 8,000                           | 1,300                 | 8,000                | 2,600                 |
| 10               | 6,500                           | 860                   | 6,500                           | 1,200                 | 6,500                | 2,400                 |
| 12               | 5,500                           | 860                   | 5,500                           | 1,200                 | 5,500                | 2,400                 |

**Consejo aplicación**

■ Profundidad de ranurado (ap)

- $D \leq \varnothing 2.5$ ,  $ap = 0.3D$
- $D > \varnothing 2.5$ ,  $ap = 0.5D$

■ Profundidad escuadrado (ap)

- $D \leq \varnothing 2.5$ ,  $ap = 1.5D$ ,  $ae = 0.05D$
- $D > \varnothing 2.5$ ,  $ap = 1.5D$ ,  $ae = 0.1D$

※ La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

**Condiciones de corte recomendadas (Esférico)**

| Herramientas     | DBE2000                         |                       | DBE4000                         |                       |

| 6                | 15,000                          | 2,950                 | 15,000                          | 4,400                 |
| 8                | 13,000                          | 3,000                 | 13,000                          | 4,500                 |
| 10               | 11,500                          | 3,000                 | 12,000                          | 4,600                 |
| 12               | 10,700                          | 3,200                 | 10,000                          | 4,700                 |

**Consejo aplicación**

■ Profundidad de corte (ap)

- $ap = 0.2D$
- $pf = 0.2D$

※ La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

**Alerta**

- Las condiciones de corte dependen de la condición de la máquina y la forma de corte
- La pieza de trabajo debe sujetarse rígidamente. En caso de vibraciones, reduzca las RPM y la velocidad de avance en la misma proporción
- Cuando el voladizo es más largo que 3D, reduzca las RPM y el avance

Buena resistencia al astillado y resistencia a la aparición del filo de aportación

# Fresa enteriza sólidas para aluminio

- Buen acabado superficial, reduciendo la carga de corte y la aparición de filo de aportación
- Recubrimiento DLC
  - Mayor dureza (Hv3000-7000), prolongando la vida útil de la herramienta, aproximadamente de 3 a 6 veces mayor en comparación con la fresa sin recubrimiento
  - Ayuda a conseguir una rugosidad superficial baja en la pieza de trabajo gracias al excelente efecto lubricante; coeficiente de fricción muy bajo ( $\mu < 0.1$ )
- Superior en aluminio, aleaciones de aluminio, cobre y aleaciones de cobre

## Características del mecanizado de cobre y aluminio

- El filo de aportación se genera fácilmente aunque la pieza de trabajo tenga baja resistencia al corte y la evacuación de virutas sea buena
- Debido a que el coeficiente de expansión térmica es alto, el grado de deflexión debido al calor de mecanizado es muy elevado, y también ejerce una influencia sobre la calidad de la pieza de trabajo y la tensión residual
- Durante el mecanizado, las virutas pueden dañar fácilmente la superficie de la pieza de trabajo, ya que la dureza de estos materiales es baja. En general, la vida de la herramienta termina debido al desgaste de los flancos.

## Resolución de problemas para el mecanizado de cobre y aluminio

- Use mayor incidencia, filo positivo, aceite de corte (MQL) para disminuir la carga de corte y el filo de aporte
- Aumente  $V_c$  y reduzca la profundidad de corte para un mejor acabado superficial

## Condiciones de corte recomendadas (SSEA2000)

### Consejo aplicación

#### Profundidad de corte (ap) y empuje (ae)

- $ap: \leq 2.0D$
- $ae: \leq 0.2D$  ( $D < \varnothing 3$ )  
 $\leq 0.5D$  ( $D \geq \varnothing 3$ )

#### Profundidad de ranura (ap)

- $ap: \leq D$  (Máx: 12 mm)

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibraciones, reduzca la R.P.M y la velocidad de avance en la misma proporción

Orden especial de endmills: SSEA○○○○○I-L

Ej.1) 3 flautas, diámetro: 6.3.I: 17, L: 60 SSEA3063 17-60L

Ej.2) 3 flautas, diámetro: 6.3. tipo standard SSEA3063

# F Información Técnica para C-Max

(Cobre)

Larga vida de la herramienta y buena rugosidad de la superficie para el mecanizado de electrodos

## C-Max

### Cobre

- Recubrimiento K-Silver y sustrato óptimo, garantizando una lubricación superior, resistencia al desgaste y resistencia al astillado
- Óptimo para el mecanizado de cobre y metales no ferrosos
- Amplia selección de productos (esférico, plano, con radio y con vástago largo)

### Características

### Ejemplo de aplicación

- **Pieza de trabajo** Cu, mecanizado de electrodos
- **Condiciones de corte**  $vc$  (m/min) = 70,  $fz$  (mm/t) = 0.083,  $ap$  (mm) = 0.6,  $ae$  (mm) = 3.0
- **Herramientas** CRE4100-070-R10

### Condiciones de corte recomendadas

| Pieza de trabajo       | CBE/CBNE                     |                    | CFE/CFNE                     |                    | CRE/CRNE                     |                    |

### Consejo aplicación

\* La pieza de trabajo debe sujetarse rígidamente En caso de vibraciones, reduzca la R.P.M y la velocidad de avance en la misma proporción

# F Información Técnica para Super Endmill for HRSA

Fresa entera para mecanizado de aleaciones termorresistentes basadas en níquel (Inconel, Hasteloy, Waspaloy, etc)

## Super Endmill for HRSA new

- Fresa para motores de la industria aeroespacial, generadores y turbinas.
- Fresa optimizada para aleaciones termorresistentes a base de Ni (Inconel, Hasteloy, Waspaloy, etc)

### ➤ Sistema de codificación

|                      |                    |  |                     |                                |                            |                       |

### ➤ Características

- Fresa exclusiva y optimizada para las industrias aeroespacial y de generación de energía. Para aleaciones termorresistentes como turbinas y motores.
- Espaciado irregular de los canales y forma de hélice: reduce las vibraciones y mejora la estabilidad en el mecanizado.
- Diseño de núcleo de alta rigidez: mejora de la evacuación de virutas y la estabilidad en el mecanizado.
- Filo de corte positivo y afilado: reduce la carga de corte y evita el endurecimiento de la pieza.
- Larga vida útil de la herramienta: Nueva calidad con sustrato de alta dureza y resistencia al desgaste.

### ➤ Características del grado

Recubrimiento con muy alta lubricación

- **Recubrimiento con lubricación excelente y tratamiento especial de la superficie**  
- Mejorada la resistencia a la soldadura y al astillamiento, mejorando la estabilidad de mecanizado

## Evaluación del desempeño

- **Pieza de trabajo** Inconel718 (HRC43~46)
- **Condición de corte** D = Ø12, vc (m/min) = 40, fz (mm/t) = 0.05, ap (mm) = 18, ae (mm) = 0.6, Refrigerante (Emulsión)
- **Herramientas** SRES4120-080-R10(Recubrimiento SL)

El sustrato de alta tenacidad proporciona un mecanizado estable y de alta calidad

- **Pieza de trabajo** Inconel718 (HRC43~46)
- **Condición de corte** D = Ø12, vc (m/min) = 40, fz (mm/t) = 0.05, ap (mm) = 18, ae (mm) = 0.6, Refrigerante (Soluble)
- **Herramientas** SRES4120-080-R10(Recubrimiento SL)

El sustrato de alta tenacidad proporciona un mecanizado estable y de alta calidad

- **Pieza de trabajo** Waspaloy (HRC36~38)
- **Condición de corte** D = Ø12, vc (m/min) = 30, fz (mm/t) = 0.04, ap (mm) = 6, ae (mm) = 18, Mecanizado troncooidal Refrigerante (Soluble)
- **Herramientas** SRES4120-080-R10(Recubrimiento SL)

El sustrato de alta tenacidad proporciona un mecanizado estable y de alta calidad

## Consejo aplicación

### ■ Profundidad escuadrado (ap)

- ap : ≤ 1,5D
- ae : ≤ 0,05D

### ■ Profundidad de ranurado (ap)

- ap : ≤ 0,2D

## Alerta

- Ajuste las condiciones de corte recomendadas de acuerdo a la condición de sus máquinas, las formas/piezas a mecanizar y el tipo de mecanizado.
- Ajuste la máquina con alta rigidez y verifique que la pieza de trabajo está sujeta firmemente.
- Seleccione el refrigerante adecuado según el material y verifique la presión y la cantidad de refrigerante.
- En caso de experimentar vibraciones, reduzca las RPM y el avance en la misma proporción.

## Router Fresa enteriza para mecanizar materiales compuestos

# Composite Router Endmill **new**

- Fresa enteriza optimizado para el maquinado de materiales compuestos en router (CFRP/GFRP)
- Excelente vida útil de la herramienta gracias al recubrimiento de diamante nanocrystalino
- Diseño de cuchilla para reducir la descamación y las rebabas
- Productividad mejorada mediante mecanizado de alta eficiencia

### Características

- Grado ND2100 con recubrimiento de diamante para el mecanizado de materiales compuestos
- Recubrimiento de diamante de alta dureza (más de 8,000 Hv)
- Recubrimiento de nano-diamante con excelente resistencia a la fricción y a la soldadura
- Mejora de la resistencia al descascarillado gracias a la aplicación del grado especializado para el recubrimiento de diamantes

Recubrimiento de nano-diamante

Recubrimiento de diamante existente

#### CCDR (Dual Helix Router Endmill)

- Diseño de doble hélice para inhibir la descamación en la parte superior y caras inferiores de las piezas de trabajo
- Fresa enteriza para desbaste, perfilado y ranurado

#### CCHR (High-performance Router Endmill)

- Filos de corte aserrados para una mayor eficiencia de mecanizado
- Fresa para desbaste, perfilado y ranurado

#### CCR (Router Endmill)

- Diseño de corte hacia abajo para bajas vibraciones y fuerza de corte
- Fresa enteriza para desbaste, perfilado y ranurado

#### CCLR (Low Helix Router Endmill)

- Menos rebabas gracias a la baja fuerza de corte axial
- Fresa enteriza para acabado, perfilado, y fabricación de ranuras ciegas

#### CCRR (Reverse Helix Router Endmill)

- Diseño de hélice inversa para evitar deslizamiento durante el curso de trabajo
- Fresa enteriza para acabado, perfilado, y fabricación de surcos pasantes

La pieza de trabajo que es menos de 45HRC garantiza el rendimiento estable

# I<sup>+</sup> Endmill

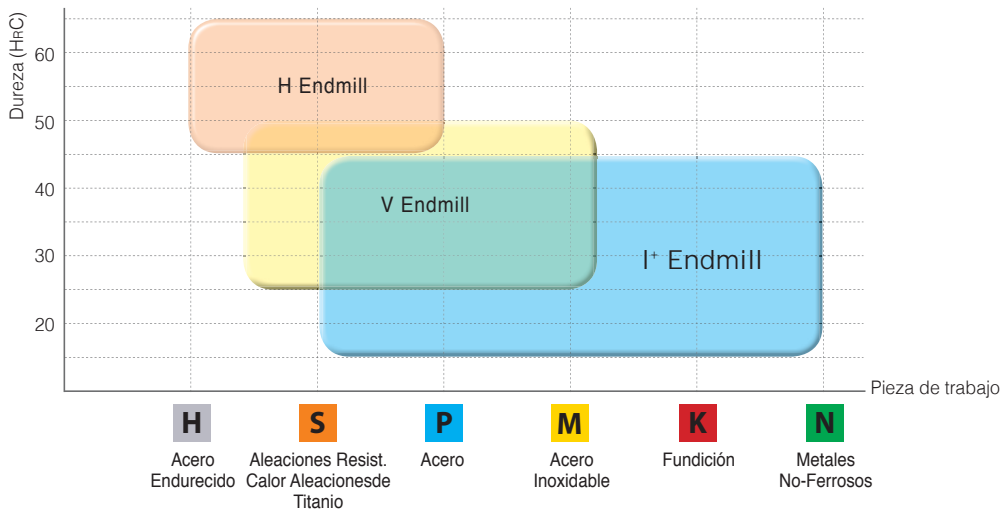

- El sustrato duro y la tecnología de recubrimiento de resistencia a desgaste aplicados
- El rango ancho de aplicación en el uso general
  - La pieza de trabajo que es menos de 45HRC garantiza el rendimiento estable
- ahorrar costos por mayor productividad

## Gama de productos

- IPBE: I Plus Endmill Esférica (Ø1~Ø20)
- IPFE: I Plus Endmill Frontal (Ø1~Ø20)
- IPRE: I Plus Endmill Radio (Ø1~Ø12)

## El Área de aplicación

## Evaluación del desempeño

- **Pieza de trabajo** SM45C
- **Condiciones de corte** Diámetro = Ø8.0, n (min<sup>-1</sup>) = 5.173, vc (m/min) = 130.0, vf (mm/min) = 1.034, fz (mm/t) = 0.1, ap (mm) = 0.5, ae (mm) = 1.6, seco
- **Herramientas** IPBE2080-060

### Resultado de la prueba

## Condiciones de corte recomendadas (plano)

### ■ IPFE2000

# F Información Técnica para Z<sup>+</sup> Endmill

Fresa entera extremadamente eficiente y económica para maquinados generales

## Z<sup>+</sup> Endmill

- Amplia gama de aplicaciones desde desbaste hasta acabado en varios tipos de materiales de dureza inferior a HRC47
- Mayor vida útil de la herramienta gracias a un nuevo sustrato y capas de recubrimiento avanzadas
- Prevención de astillado y mayor vida útil gracias al diseño optimizado del filo de corte

### Características

- Amplia gama de materiales de piezas de trabajo: acero al carbono, acero aleado, hierro fundido, etc
- Vida útil prolongada de la herramienta - Se aplica un sustrato recién inventado y capas de revestimiento de alta tecnología
- Mayor productividad: amplio rango de aplicaciones desde desbaste hasta acabado

PC320U

- Capa de revestimiento AlCrSiN  
: Recubrimiento lubricante hace posible mecanizado de alta temperatura/alta velocidad
- Sustrato ultra fino  
: Sustrato con excelente resistencia al desgaste

Filo en buen estado

Z<sup>+</sup> Endmill

Rigidez de corte excepcional

competidor

### Ejemplo de Aplicaciones

- **Pieza de trabajo** Acero de carbono (C45, ~HRC20)
- **Condición de corte**  $vc$  (m/min) = 180,  $fz$  (mm/t) = 0.05,  $ap$  (mm) = 8, seco
- **Herramientas** ZPFE4080-060

#### Resultado de la prueba

25% más

- **Pieza de trabajo** Acero de carbono (C45, ~HRC20)
- **Condición de corte**  $vc$  (m/min) = 130,  $fz$  (mm/t) = 0.1,  $ap$  (mm) = 0.5, seco
- **Herramientas** ZPBE2080-100

#### Resultado de la prueba

33% más

### Consejo aplicación

- Profundidad de ranurado ( $ap$ )
- $ap: \leq 0.3D$

- Profundidad escuadrado ( $ap$ )
- $ap: \leq 1.5D$
- $ae: \leq 0.1D$

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

## Alerta

- Ajuste las condiciones de corte recomendadas correctamente, de acuerdo con las condiciones de sus máquinas, Las formas objetivo, y su propósito para el mecanizado
- La pieza de trabajo debe sujetarse rígidamente. En caso de vibraciones, reduzca las RPM y la velocidad de avance en la misma proporción
- En caso de sobresalir sobre 3D, reducir las RPM y la velocidad de alimentación

Fresa enteriza para acero inoxidable

# S<sup>+</sup> Endmill

- Filo robusto asegura una larga vida útil de la herramienta
- Recubrimiento especial con alta resistencia a la oxidación
- El alto ángulo de incidencia y el desahogo curvilíneo de la viruta permiten una óptima evacuación
- Geometría especial del filo evita el endurecimiento (temple) de las herramientas
- Maquinabilidad óptima en el mecanizado de acero inoxidable
- Disponible para acero, acero de aleación y el mecanizado de acero endurecido
- Disponible para múltiples operaciones (escuadrado, ranurado y rampa, etc.)

## El Área de aplicación

## Evaluación del desempeño

- **Pieza de trabajo** STS304
- **Condiciones de corte** Diámetro = Ø8.0, n (min<sup>-1</sup>) = 4.000, vc (m/min) = 100, vf (mm/min) = 480, fz (mm/t) = 0.04, ap (mm) = 8, ae (mm) = 0.8, seco
- **Herramientas** SPFE4080-060

## Consejo aplicación

### ■ Profundidad escuadrado (ap) y profundidad radial (ae)

- Acero normal, acero de aleación, acero inoxidable: ap = 1.5D, ae = 0.1D
- Aleación de titanio, Inconel, acero endurecido: ap = 1.5D, ae = 0.05D

### ■ Profundidad de ranurado (ap)

- Acero normal, acero de aleación: ap = 1.0D
- Acero inoxidable: ap = 0.3D
- Aleación de titanio, Inconel, Acero endurecido: ap = 0.2D

## Mecanizado de acero inoxidable

- La baja conductividad térmica de la aleación de acero inoxidable provoca la conducción de calor a la herramienta y la fractura y astillado
- El acero inoxidable presenta alta resistencia de corte y causa mucho desgaste en las herramientas de corte.
- El mecanizado de alta temperatura en aleación de acero inoxidable reduce las condiciones de corte y disminuye la calidad de la rugosidad de la superficie

## Resolución de problemas para el acero inoxidable

- Obtención de bajas condiciones de corte
- Profundizando en la capa endurecida por el trabajo y utilizando herramientas con filo afilado
- Use refrigerante

# F Información Técnica para R<sup>+</sup> Endmill

## Fresa de desbaste de alta eficiencia

# R<sup>+</sup> Endmill **new**

- Diseño de filos rentable para el mecanizado de desbaste
- Filos de corte especialmente diseñados para disminuir la carga mecánica, así como un espaciado irregular entre canales y ángulos de ataque irregulares que disminuyen la carga de corte.

### Característica

- Excelente eficiencia de mecanizado: diseño especial para corte de medio a desbaste
- Mayor vida útil de corte: costo de la herramienta mejorado gracias a los nuevos grados aplicados
- Mayor rendimiento de corte - Diseño de cuchilla ideal para desbaste

#### Fuerza de corte más baja Corte más suave

- Ideal para corte medio a corte basto
- Diseño de filo especial

- Bordes dentados
- 3 Combo R

- Espaciado irregular de la flauta para prevenir golpeteo ( $\alpha_1 \neq \alpha_2$ )

- Ángulos de ataque irregulares para dispersar la fuerza de corte ( $\beta_1 \neq \beta_2$ )

### sistema de grados

Fresas enterizas para mecanizado de aluminio

# A+ Endmill

- Fresas enterizas para mecanizado de aluminio y todo tipo de aplicaciones: de desbaste a acabado.
- Solución optimizada para aplicación de aluminio: selección variada de herramientas para distintos tipos de mecanizado.
- Alto rendimiento: diseño de alta tecnología de los filos de corte y de los canales.

## Características

**APFE**

**Filos de corte agudos y ángulo de incidencia doble**

- Carga de corte reducida
- Se inhibe la rotura de los filos de corte gracias a su diseño reforzado

**Canales con forma de "U" y pulido de excelente acabado superficial**

- Evacuación de viruta eficiente gracias a los canales anchos
- Se inhibe la aparición del filo de aportación gracias a la superficie pulida de los filos de corte

**AFE**

**Filos de corte agudos**

- Vida útil larga y mejorado el rendimiento de la herramienta
- Carga de corte reducida

**Superficie de los canales pulida**

- Filo de aportación inhibido
- La inhibición de los filos de aportación ayuda a reducir la carga de corte

**RPAE**

**Filo de corte con ranuras ondulantes**

- Carga de corte menor
- Evacuación de viruta eficiente a través de las ranuras que actúan como rompevirutas

**Filo de corte agudo**

- Carga de corte reducida
- Reducción de la carga mecánica también a la maquinaria

## Ejemplos de aplicación

- **Pieza de trabajo** Mandril (A7075)
- **Condiciones de corte**  $vc$  (m/min) = 200,  $fz$  (mm/t) = 0.05  
 $ap$  (mm) = 8,  $ae$  (mm) = 2, con refrigerante
- **Herramientas** APFE3080-060

■ Resultado de la prueba

30% mayor duración

- **Pieza de trabajo** Fresado de la parte interior de smartphone (Al60 series)
- **Condiciones de corte**  $vc$  (m/min) = 65,  $fz$  (mm/t) = 0.02  
 $ap$  (mm) = 1,  $ae$  (mm) = 1, con refrigerante
- **Herramientas** AFE3010-050-V3S6

■ Resultado de la prueba

20% mayor duración

- **Pieza de trabajo** Desbaste de superficie rectangular (Al70 series)
- **Condiciones de corte**  $vc$  (m/min) = 330,  $fz$  (mm/t) = 0.05  
 $ap$  (mm) = 15,  $ae$  (mm) = 1.5, seco
- **Herramientas** RPAE3100-080

■ Resultado de la prueba

50% más

### Consejo aplicación

#### Profundidad escuadrado (ap)

- ap :  $\leq 2,0D$
- ae :  $\leq 0,2D (D < \varnothing 3)$   
:  $\leq 0,5D (D \geq \varnothing 3)$

#### Profundidad de ranurado (ap)

- ap :  $\leq D$  (Máx 12 mm)

\* La pieza de trabajo debe sujetarse rígidamente. En caso de vibración, reduzca R.P.M y la velocidad de avance en la misma proporción

# F Información Técnica para PCD Endmill

Mayor duración de la herramienta y buena rugosidad de la superficie

## PCD Endmill

- Mayor duración de la herramienta y buena rugosidad de la superficie
- Reducción de la rebaba en el maquinado de metales no-ferrosos
- Serie 1000: Para acabado Ultrafion en Metales No-Ferrosos
- Serie 2000: Recomendada para Aleaciones de Aluminio, Acero al Carbon, grafito y maquinado de plástico reforzado

### ➤ Fresa integral PCD: sistema de codificación

### ➤ Condiciones de corte recomendadas

| Pieza de trabajo            | vc (m/min) | n (min <sup>-1</sup> ) | fz (mm/t) |
|-----------------------------|------------|------------------------|-----------|
| Aleación de Aluminio, Cobre | 30~300     | 2,000~12,000           | 0.02~0.07 |
| Plastico Reforsado          | 35~300     | 2,800~16,000           | 0.04~0.12 |
| Acero al Catbon, Grafitoo   | 10~100     | 5,300~16,000           | 0.04~0.2  |

# F Información Técnica para Brazed Endmill

Diseño que permite un maquinado con mayor precisión

## Brazed Endmills

- Aplicable para maquinado de alta velocidad ya que reduce la resistencia a la fricción mientras mejora su resistencia al desgaste al implementar un recubrimiento exclusivo de PVD.
- Herramienta de larga vida debido a la absorción de impacto a través del cuerpo cementado en corte interrumpido pesado
- Para maquinado en Acero en general, Aleacion de Acero, Acero Medio, Acero Inoxidable, Acero Ductil, Fundición, Fundición Dustil
- Serie ZSEA: Aluminio, Aleaciones de Aluminio, Cobre, Aleaciones de Cobre, Metales No-Ferrosos
- Endmills Cementados con Recubrimiento (Especiales) Garantiza una larga vida a la herramienta debido a la aplicación de un nuevo recubrimiento resistente a la oxidación

### Características

- **Capa Superior**  
Recubrimiento resistente a la oxidación
- **Capa Principal**  
Evita la adherencia dematerial al filo Mayor resistencia al astillamiento
- **Substrato Ultrafino**

Recubrimiento PC221F

| 30  | 1,100                           | 180                   | 650                             | 96                    | 370                             | 48                    |
| 40  | 800                             | 145                   | 500                             | 85                    | 280                             | 36                    |
| 50  | 650                             | 135                   | 400                             | 72                    | 220                             | 30                    |

### Consejo aplicación

#### ■ Escuadrado (por debajo de 45 HRC)

- ap:  $\leq 1.5D$
- ae:  $\leq 0.1D$

#### ■ Escuadrado (por encima de 45 HRC)

- ap:  $\leq 1D$  (Máx: 1mm)

- \* Datos mencionados arriba basados en fresado lateral, cuando entra en dirección ae, debe reducir condición de corte
- \* Cuando entra en dirección ae, para terminar debe aumentar la velocidad y avance

## Brocas

Las brocas Korloy proporcionan una solución total para la fabricación de agujeros, basado en el know-how de herramientas, así como una amplia investigación y desarrollo de nuestras herramientas

## Información Técnica para Brocas

- G02 Índice de Brocas
- G04 Insertos disponibles

## Brocas Indexables

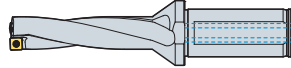

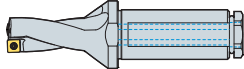

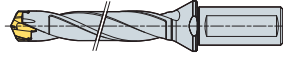

- G06 Información Técnica para King Drill
- G12 King Drill
- G21 Información Técnica para King Drill  
(Para el sistema de refrigerante perforante)
- G22 King Drill (Para el sistema de refrigerante perforante)
- G25 Información Técnica para King Drill  
(para taladrado de diámetro grande)
- G26 King Drill (para taladrado de diámetro grande)
- G27 Información Técnica para TPDC
- G31 TPDC
- G34 Información Técnica para TPDB Plus
- G38 TPDB Plus
- G44 Información Técnica para TPDB-H
- G47 TPDB-H
- G51 Información Técnica para WPDC
- G54 Center Drill
- G55 WPDC

## Brocas Solidas

- G57 Información Técnica para Mach Solid Drill Plus
- G59 Mach Solid Drill Plus
- G64 Información Técnica para Mach Solid Drill Plus-S
- G66 Mach Solid Drill Plus-S
- G70 Información Técnica para Mach Solid Drill plus CFRP
- G72 Mach Solid Drill Plus CFRP
- G73 Información Técnica para Mach Solid Flat Drill
- G76 Mach Solid Flat Drill
- G82 Información Técnica para Mach long Drill Plus
- G84 Mach long Drill Plus
- G87 Modelo orden Mach step Drills
- G88 Información Técnica para Vulcan Drill
- G89 Vulcan Drill
- G91 Información Técnica para ESD Plus
- G93 ESD Plus
- G98 Información Técnica para Carbide Drill (SSDP)
- G99 Carbide Drill (SSDP)
- G101 Burnishing Drill
- G102 Top Solid Drill
- G103 PCD Drill
- G104 Información Técnica para Gun Drill
- G108 Gun Drill

## Escariadores

### ➤ Características

- Diseño Optimizado del Inserto para un máximo y eficiente barrenado
- Excelente rendimiento de corte y control de la viruta debido a la geometría optimizada y a las rompevirutas de ambos Insertos, central y periférico
- Insertos diferentes, optimizados para las posiciones centrales y periféricas con el fin de maximizar la vida útil de corte

#### Canales optimizados - 2 orificios de refrigerante aplicados

La forma optimizada del canal aumenta la rigidez del cuerpo de la broca y mejora la evacuación de viruta.

### ➤ Características de las geometrías

**Cadena de eslabones de arbusto**

- **Uso** Cadena de eslabones de arbusto
- **Material** SM45C
- **Condición de corte** vc (m/min) = 120, fn (mm/rev) = 0.1 por medio del sistema de refrigeración
- **Herramientas insertos** SPMT07T208-PD (PC3500)  
XOMT07T205-PD (PC5300)  
**Porta** K5D20025-07
- **Maquina** Drilling machine

■ **Resultado de la prueba**

• Acabado superficial y evacuación de la viruta superior

- **Uso** Cadena de eslabones de arbusto
- **Material** SCM415H
- **Condición de corte** King Drill: vc (m/min) = 140, fn (mm/rev) = 0.12  
Competidor: vc (m/min) = 125, fn (mm/rev) = 0.1
- **Herramientas insertos** SPMT090308-PD (PC3500)  
XOMT090305-PD (PC5300)  
**Porta** K3D27032-09
- **Maquina** MCT

■ **Resultado de la prueba**

• Mayor productividad debido a las mayores capacidades para condiciones de corte más exigentes en comparación con la competencia

**Condiciones de Corte Recomendadas**

• En caso de 5D, reducir 70~80% la condición de corte de la broca anterior  
 • En maquinado interrumpido, reducir 30~50% del avance de la broca anterior maquinando alrededor de la parte interrumpida

## ➤ Fuerza de corte requerida

- Los gráficos siguientes muestran la fuerza de corte requerida en la perforación
- Maquinado con una King Drill y una máquina con una alta rigidez y poder

- **Pieza de Trabajo** SCM440 (240HB)
- **Condición**  $vc$  (m/min) = 100, Con Sistema de Refrigeración Interna de corte

—○—  $fn$  (mm/rev) = 0.13    
 —○—  $fn$  (mm/rev) = 0.10    
 —○—  $fn$  (mm/rev) = 0.07

## ➤ Cantidad de refrigerante en el corte

- **Pieza de Trabajo** SCM440 (240HB)
- **Condición**  $vc$  (m/min) = 100, Con Sistema de Refrigeración Interna de corte

- Presión de refrigerante recomendada: alrededor de 5kg/cm<sup>2</sup>
- Los datos de la gráfica anterior se podría cambiar dependiendo de la pieza de trabajo y la condición de corte

## ➤ Tolerancia de la Broca y del Barreno

| Diámetro de la Broca |                             | Ø12~Ø29     | Ø30~Ø45    | Ø46~Ø60.5   |
|----------------------|-----------------------------|-------------|------------|-------------|
| 2D~3D                | Tolerancia de la Broca (ØD) | 0~-0.15     | 0~-0.15    | 0~-0.15     |
|                      | Tolerancia del Barreno      | +0.2~-0.1   | +0.25~-0.1 | +0.28~-0.1  |
| 4D~5D                | Tolerancia de la Broca (ØD) | 0~-0.15     | 0~-0.15    | 0~-0.15     |
|                      | Tolerancia del Barreno      | +0.25~-0.05 | +0.3~-0.05 | +0.33~-0.05 |

## ➤ Aviso para configuración de la broca en el torno

- Establezca el Inserto periférico en paralelo al eje X. (basado en un bloqueo lateral)
- Si el núcleo maquinado es de 0.5 mm después del mecanizado de 5mm, es el ajuste apropiado

※ Por favor, asegúrese de que la ubicación de la traba interna de seguridad ya que puede ser diferente en función de los fabricantes de maquinaria

## El rango de ajustar el diámetro de mecanizado en torno

- En el torneado, el King Drill puede extender y reducir diámetro de mecanizado moviéndose a X axis. Favor de referir a la table que muestra el rango de ajustar diámetro de taladro abajo
- Más el diámetro de taladro se extiende o se reduce , más la broca pierde la balance de taladro

| Dia de broca (Ø) | El rango de ajustar diámetro de taladro (Ø) | Dia de broca (Ø) | El rango de ajustar diámetro de taladro (Ø) | Dia de broca (Ø) | El rango de ajustar diámetro de taladro (Ø) | Dia de broca (Ø) | El rango de ajustar diámetro de taladro (Ø) |

- En la fijación del Inserto, limpie el asiento y aplicar el CASMOLY 1000 en el tornillo
- Asegúrese de utilizar tornillos Korloy solamente

## King Drill - para mecanizar un grifo de agujero fundamental

- Hay dos tipos de especificaciones de grifo, métrico y inch. El King Drill es disponible para mecanizar grifo ciego y grifo total

(mm)

| Tipo de grifo | Rosca       | ØD   | Código      | Referencia |
|---------------|-------------|------|-------------|------------|
| Métrico       | M14 x 2.0   | 12.0 | K3D12020-04 | G14        |
|               | M16 x 2.0   | 14.0 | K3D14020-05 | G14        |

**Formato Orden Especial de Brocas**

**■ Tipo de refrigerante**

Refrigerante con toma estándar     Refrigerante sin toma estándar     Sin refrigerante

**■ Tipo de Agujero**

Agujero ciego     Agujero total

**■ Tipos de mango**

Tipo Recto

Tipo Weldon

Tipo Whisthe Notch

**■ Posición del Perno de Sujeción**

Paralelo al Inserto Periférico (Estándar)

A 90° del Inserto Periférico (Estándar)

A 180° del Inserto Periférico (Estándar)

A 270° del Inserto Periférico (Estándar)

**■ Nota**

- Herramienta usada Actualmente:
- Condición de corte Actual
  - RPM or vc (m/min):
  - vf (mm/min) or fn (mm/rev):
  - Profundidad de corte (mm):

- estándar de medición duración de la herramienta:
- Maquina usada Actualmente
  - Centro de maquinado:
  - Torno Convencional:
  - Torno CNC:

# King Drill (2D)

Placas Disponibles G04-05

Broca con el sistema de refrigerante perforante para torno general y torno de CNC  
sin sistema de refrigerante interno

## King Drill (Para el sistema de refrigerante perforante)

- El sistema de refrigerante perforante con porta, toma estándar, manguera de agujero de aceite, bomba de agujero de aceite de broca
- PT TAP en toma estándar es combinado a PT TAP conectado a la manguera de aceite
- Disponible para usar la broca sin un toma estándar en mecanizado de fresado

(mm)

Placas Disponibles G04-05

La gran rigidez de la broca reduce los gastos debido a la sustitución del cartucho

## King Drill (para taladrado de diámetro grande)

- Tipo de cartucho para taladro de  $\text{Ø}61\sim\text{Ø}100$
- Cartucho Perpérico puede ajustar el diámetro de taladro dentro de 5mm
- Fácil de ajustar diámetro de taladro con el tornillo de ajustar

### ⌚ Ajuste del diámetro de taladrado

| Ajuste<br>Ø (mm) | Arandela de ajuste |            |
|------------------|--------------------|------------|
|                  | Código             | Ancho (mm) |
| 1                | WA0305             | 0.5        |
| 2                | WA0310             | 1.0        |
| 3                | WA0305+WA0310      | 1.5        |
| 4                | WA0310x2           | 2.0        |
| 5                | WA0305+WA0310x2    | 2.5        |

※ La arandela de ajuste ajusta el diámetro de taladrado hasta 5mm

Broca indexable de punta cónica

**TPDC** **new**

- Diseño de sujeción
  - Sistema de amarre de un solo paso → Mayor estabilidad
  - Sistema de sujeción que permite cambiar las inserciones mientras el cuerpo está conectado a la máquina → Tiempo de configuración reducido
- Diseño optimizado de la cuchilla
  - Excelente control de viruta → Posibilidad de uso para varios tipos de piezas de trabajo
- Sistema de salida de refrigerante en forma helicoidal
  - Área amplia de desalajo para la viruta → Mejor lubricación + flujo de virutas mejorado
- Tecnología de materiales
  - Sustrato ultrafino + Aplicación de recubrimiento multicapa → Excelente resistencia al descamado y al desgaste

➤ Sistema de Codificación

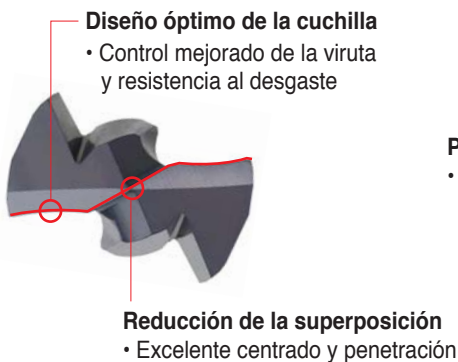

Porta

insertos

➤ Características

## Características del sistema de sujeción

- Sistema de amarre de un solo paso → Cambio de herramienta fácil y rápido, mantiene posición
  - Área de sujeción: Cambio de herramienta fácil y rápido
  - Área antirrotación: actúa como un tope
  - El área de sujeción y antirrotación forma un ángulo agudo para evitar la rotación del inserto durante el mecanizado

## Evaluación de desempeño

| Test de durabilidad           |  |
|-------------------------------|--|
| ■ <b>Pieza de trabajo</b>     | SCM440 (HRC22)   |
| ■ <b>Condiciones de corte</b> | Diámetro del taladro (mm) = Ø15.0<br>vc (m/min) = 90, fn (mm/rev) = 0.25<br>ap (mm) = 60, con refrigerante |
| ■ <b>Herramientas</b>         | <b>Insertos</b> TPD1500CP (PC5335)<br><b>Porta</b> TPDC5D-15020-75   |

Después de usar 40 insertos, el run-out del montaje permanece debajo de 15µm

Después de sujetar 150 veces, el run-out de la broca permanece

## Cadena de eslabones de arbusto

- En caso de 8D, reducir 40~50% la condición de corte ó maquinado el principio del orificio (1.5D)
- En maquinado interrumpido, reducir 30~50% del avance maquinando alrededor de la parte interrumpida
- En caso de 10~12D, referir a las condiciones recomendadas de corte como abajo.
- En maquinado de acero inoxidable, procese con el avance bajo, establezca la mejor condición de corte comprobando la maquinabilidad gradualmente

## Consejo de refrigeración

- **Pieza de trabajo** SCM440 (HrC22)
- **Condiciones de corte** vc (m/min) = 100, con refrigerante

## Cómo conseguir una buena sujeción del inserto

① Limpie el asiento de montaje con aire o tela

② Coloque un inserto en el soporte

③ Una parte de la llave y la parte B del inserto deben estar paralelas entre sí antes de ajustar el inserto. Gire la llave en sentido horario para finalizar la fijación

**Inserto en sujeción**

## Precauciones al configurar

Ajuste del equipo horizontal

Ajuste del equipo vertical

## Precauciones al perforar

| Rampa  | Planos superpuestos  | Corte parcial | Perforación previa |
|--|--|---------------|--------------------|
|  |  |               |                    |
| <ol style="list-style-type: none"> <li>Una pendiente inclinada más de 6° no está permitida</li> <li>Al ingresar, reduzca el avance a 30 ~ 50%</li> </ol> | <ol style="list-style-type: none"> <li>El espacio entre planos afecta la evacuación de la viruta</li> <li>Evitar dejar espacio entre los planos</li> </ol> | no permitido  | no permitido       |

## Condiciones de corte recomendadas en taladrado de agujeros profundos (10D, 12D)

### Taladrado con broca guía (recomendado)

| 1. Taladro de un primer agujero con broca guía  | 2. Comienzo del taladrado  |
|---|--|
|   |  |
| Taladre un primer agujero de profundidad 0.5D, con velocidad de corte al 70% de la velocidad general recomendada y usando una broca 1.5D o 3D | Después de cambiar la broca, comience a taladrar con las condiciones de corte recomendadas |

### Taladrado sin broca guía

| 1. Taladre primero un primer agujero (sin broca guía)  | 2. Deje de taladrar   | 3. Prepare el proceso de taladrado principal   | 4. Comience el proceso de taladro normal                       |
|--|---|--|--|
|  |   |  |  |
| Taladre un primer agujero de profundidad 0.5D, con velocidad de corte al 70% de la velocidad general recomendada. Deje de talabrar durante unos 2-3 segundos sin retirar la broca del agujero. | Retire la broca sin evacuar lubricante. Espere unos 2-3 segundos. | Inserte la broca en el agujero hasta quedar unos 2-3 mm por encima de la superficie antes mecanizada. Taladre durante 2-3 segundos antes de comenzar a lubricar. | Comience a taladrar con las condiciones de corte recomendadas. |

Broca indexable de excelente precisión y alto rendimiento

## TPDB Plus **new**

- Sistema de amarre de alta precisión. Precisión de anclaje muy alta con el sistema de autocentrado y los componentes pulidos de alta precisión que componen el siste de sujeción.
- Amarre con tornillo. Cambio de insertos sencillo.
- Filo de corte agudo. Baja carga mecánica y buen control de viruta.
- Portaherramienta de excelente durabilidad. Portaherramienta de alta rigidez y con la superficie tratada para garantizar una muy alta resistencia al desgaste.
- Portaherramienta ofrece un excelente control de viruta. Baja carga de corte y evacuación de viruta espectacular gracias al ángulo de hélice.

### 🔗 Sistema de Codificación

#### Broca

#### Inserto

### 🔗 Características

**Tratamiento especial de la superficie**  
• Durabilidad mejorada

**Sistema de sujeción con tornillo**

**Sistema de Auto-centrado**

#### Ángulo helicoidal optimizado

- Alta productividad
  - Evacuación de viruta segura, garantizando un mecanizado estable
  - Mejores condiciones de corte, reduciendo tiempo de mecanizado
- Excelente grado
  - Garantiza un buen acabado y un agujero con las dimensiones deseadas

**Control de viruta avanzado gracias al rompevirutas**

**Filo de corte que genera baja carga mecánica**

- Baja carga de corte y excelente control de viruta

### Rango de aplicación

| Herramientas | Rango de aplicación      |                                       |                                     |            |                                       |          |
|--------------|--------------------------|---------------------------------------|-------------------------------------|------------|---------------------------------------|----------|
|              | Diámetro de la broca (Ø) | Relación de diámetro y longitud (L/D) | Tolerancia del diámetro de la broca | Tolerancia | Terminación, acabado superficial (Ra) | Material |
| TPDB Plus    | 10-32.9 mm               | 3, 5, 8, 10, 12                       | h7                                  | IT10       | ≤ 2.0µm                               | P, K     |

### Evaluación de desempeño

#### Excentricidad

- **Pieza de Trabajo** Aleación de Acero (SCM440)
- **Condición de corte** Diámetro del taladro (mm) = Ø25, vc (m/min) = 90, fn (mm/rev) = 0.25, ap (mm) = 120, con refrigerante (20 bares)
- **Herramientas** TPDB250-32-5-P(PC5300)

#### Carga de corte

- **Pieza de Trabajo** Aleación de Acero (SCM440)
- **Condición de corte** Diámetro del taladro (mm) = Ø25, vc (m/min) = 120, fn (mm/rev) = 0.25, ap (mm) = 120, con refrigerante (20 bares)
- **Herramientas** TPDB250-32-5-P (PC5300)

### Excelente redondez del agujero

- **Pieza de Trabajo** Aleación de Acero (SCM440)
- **Condición de corte** Diámetro del taladro (mm) = Ø25, vc (m/min) = 90/120, fn (mm/rev) = 0.25/0.35, ap (mm) = 120, con refrigerante (20 bares)
- **Herramientas** TPDB250-32-5-P (PC5300)

## ➤ Condiciones de Corte Recomendadas

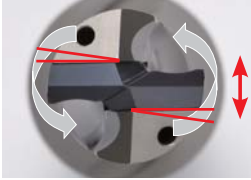

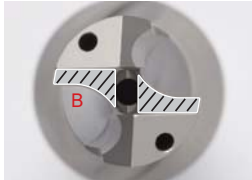

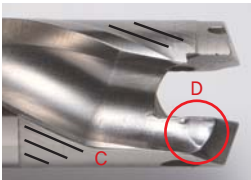

| Material |                             |                                       | Grado   | vc<br>(m/min)    | Dimensiones (L/D) = 3D, 5D                             |           |           |           |
|----------|-----------------------------|---------------------------------------|---------|------------------|--|-----------|-----------|-----------|
| ISO      | Materiales pieza de trabajo | HB                                    |         |                  | Avance (mm/rev) Dependiendo del Diam. de la broca (mm) |           |           |           |
|          |                             |                                       |         |                  | Ø10~Ø16.9  | Ø17~Ø26.9 | Ø27~Ø32.9 |           |

|          |                             | Aleación baja en Acero Pre-endurecido | 200~400 | PC5300           | 75(50~100)   | 0.18~0.35 | 0.23~0.38 | 0.28~0.43 |
|          |                             | Aleación baja en Acero                | 50~260  | PC5300           | 70(50~90)  | 0.18~0.30 | 0.20~0.35 | 0.25~0.40 |
|          | Acero Altamente Endurecido  | 220~450                               | PC5300  | 60(40~80)        | 0.18~0.30  | 0.20~0.35 | 0.25~0.40 |           |
| K        | Fundición                   | Fundición Gris                        | 150~230 | PC5300           | 110(80~140)  | 0.18~0.35 | 0.20~0.40 | 0.25~0.45 |
|          |                             | Fundición Dúctil                      | 160~260 | PC5300           | 100(70~130)  | 0.18~0.35 | 0.20~0.40 | 0.25~0.45 |

※ En el caso de longitudes de 8D: reduzca condiciones de corte un 20-30% o mecanice un primer orificio (1.5D) antes de perforar.

※ En mecanizado con interrupción: reduzca el avance a 0,1-0,15 al mecanizar la parte que presenta interrupciones.

※ Refiérase al método de perforación recomendado en la página 37 para taladros 10D -12D

## ➤ Reemplazo de portaherramientas y tornillos

| Parte con desgaste   | Método de comprobación   | Descripción  |
|--|--|--|
| [Imagen.1]<br>  | [Imagen.2] Compruebe el espaciado<br> | <ul style="list-style-type: none"> <li>• Después de taladrar durante mucho tiempo, puede suceder que la parte A de la imagen 1 sufra cierto grado de desgaste y se rasgue o doble por el torque.</li> <li>• Como se muestra en la imagen 2, verifique el espacio entre inserto y el asiento girando el inserto de un lado a otro. Si hay un espacio entre ambos, reemplace el portaherramientas usado por uno nuevo.</li> </ul>  |
| [Imagen.3]<br>  | [Imagen.4] Compruebe si se mueve<br>  | <ul style="list-style-type: none"> <li>• El inserto podría llegar a moverse de arriba a abajo debido a la carga en el eje Z, después de haber usado la herramienta durante un largo periodo de tiempo, lo cual podría causar un desgaste extra en la parte B, tal y como se muestra en la imagen 3.</li> <li>• En caso de que después de insertar un inserto, éste se mueva o haya un espacio entre el inserto y el asiento, como se muestra en la imagen 4, reemplace el portaherramientas usado por uno nuevo.</li> </ul>    |
| [Imagen.5]<br>  | Compruebe si se mueve<br>             | <ul style="list-style-type: none"> <li>• El tornillo de sujeción, después de usarlo durante un periodo largo de tiempo, puede llegar a desgastarse, reduciendo la fuerza de sujeción como se muestra en la imagen 5, parte E. En este caso, se recomienda reemplazar el tornillo usado por uno nuevo (con cada broca se incluyen varios tornillos extra).</li> <li>• Se recomienda lubricar el tornillo para alargar la vida útil.</li> </ul>  |
| [Imagen.6]<br>① Compruebe las partes C y D, como se muestra en la imagen 6<br>② Compruebe si a medida que mecaniza las virutas cada vez son más largas |                                       | <ul style="list-style-type: none"> <li>• Virutas enrolladas o atascadas durante el mecanizado pueden desgastar o causar rozaduras en la parte C, como se muestra en la imagen 6. Esto puede ser debido al uso de condiciones de corte incorrectas. En ese caso, recomendamos reajustar las condiciones de corte y comprobar la excentricidad antes de volver a mecanizar.</li> <li>• El desgaste excesivo en la parte D mostrada en la imagen 6 puede ser causada por virutas largas enrolladas en torno al cuerpo.</li> </ul> |

## 🔗 Sujeción de los insertos TPDB Plus: instrucciones

### Sujeción del inserto en el portaherramientas

- 1 Coloque el inserto en el asiento del portaherramientas
- 2 Como se muestra en la imagen 1, introduzca el inserto de tal forma que encaje en la ranura del portaherramientas
- 3 Atornille para sujetar el inserto

### Cambio de insertos

- 1 Desatornille y separe el inserto usado del portaherramienta
- 2 Limpie el asiento del inserto (imagen 2)
- 3 Coloque un nuevo inserto en el asiento
- 4 Como se muestra en la imagen 3, introduzca el inserto presionando con la mano para que no se separe del portaherramientas

## 🔗 Precauciones a considerar en taladrado

### Rampa

1. El ángulo de aproximación/entrada entre la broca y la pieza al comienzo del taladrado debe ser de menos de 6°.
2. Reduzca el avance a un 30-50% de las condiciones de corte recomendadas en el comienzo o final del mecanizado en pendiente.

### Planos superpuestos

1. El espacio limitado entre las láminas puede dificultar la evacuación de virutas dañando el cuerpo del taladro.
2. Sujete las láminas de manera que el espacio intermedio sea lo más reducido posible (idealmente no debería haber espacio).

### Taladrado en plunge

1. La carga mecánica irregular en mecanizado en plunge puede causar la fractura o deformación de la broca.

### Mandrinado

1. No se recomienda el mandrinado por el desgaste que se ocasiona en las esquinas de los insertos.

## 🔗 Parámetros a comprobar en taladrado.

- Condición de la pieza de trabajo y sujeción
- Revolución del eje principal de la máquina
- Condición del portaherramientas
- Excentricidad de la broca (Máx. 0.03 mm)
- Condición del suministro de refrigerante (presión, concentración, etc)
- Evacuación de viruta

## 🔗 Suministro de refrigerante

- Suministre suficiente refrigerante al comienzo del mecanizado
- Presión mínima de refrigerante de aceite: 5 bares
- Flujo mínimo de refrigerante: 5 l/min

## 🔗 Método de taladrado recomendado (10D, 12D)

### Taladre un primer agujero (con broca guía)

Taladre un primer agujero de profundidad 0.5D, con velocidad de corte un 30% menor de la velocidad general recomendada usando una broca 1.5D o 3D

### Comience el proceso de taladro normal

Cambie la broca guía por la deseada y comience a taladrar con las condiciones de corte recomendadas.

Buen acabado superficial

Resultados taladrado recomendado

Resultados taladrado general

Placas Disponibles G38

## Broca indexable exclusiva para taladrado de vigas y otras piezas estructurales, Perfil H

# TPDB-H new

- Broca exclusiva de alto rendimiento para el taladrado de vigas y estructuras de acero, como vigas perfil H, planchas de acero, etc.
- Sistema de sujeción de alta precisión: rectificado de alta precisión y sistema de auto-centrado que aumentan la calidad de la sujeción
- Sujeción con tornillo: fácil de reemplazar
- Inserto diseñado con capacidad de autocentrado: reducción de carga de corte y mejor control de viruta
- Portaherramienta de gran durabilidad: Superficie tratada especialmnete para mejorar resistencia y durabilidad
- Portaherramientas con excelente evacuación de viruta: Ángulo helicoidal optimizado para asegurar una buena evacuación de viruta y reducir la carga mecánica
- Conducto de lubricación óptimo: alarga vida útil

### 🔗 Sistema de Codificación

#### Broca

#### Inserto

### 🔗 Características del inserto

- ↓ Punta optimizada con forma de doble R para reducir la vibración y el traqueteo mejora la capacidad de centrado y asegura un mejor mecanizado
- ↓ Se reduce el astillado en las esquinas del filo de corte gracias a la flexión y la vuelta a la forma original de la viga

## Características del portaherramientas

↓ ↓ La concentración de la lubricación en puntos más delicados del filo de corte ayudan a prolongar la vida útil

## Grados recomendados

### • PC340Q

- Recubrimiento PVD de alta tecnología: recubrimiento de alta dureza y lubricación con resistencia al desgaste, a la soldadura y al astillado.
- El tratamiento especial de la superficie mejora la evacuación de la viruta y reduce el desgaste en las caras del inserto.
- Sustrato ultra fino de alta dureza que garantiza un filo de corte de alta rigidez y buena resistencia al astillamiento

## Evaluación de desempeño

### Control de viruta

- **Pieza de trabajo** Acero al Carbón (SS400, SM490A)
- **Condiciones de corte** Diámetro del taladro (mm) =  $\varnothing 27$ , vc (m/min) = 80  
fn (mm/rev) = 0.2, ap (mm) = 30, con refrigerante
- **Herramientas** **Insertos** TPD270B-H (PC340Q)  
**Porta** TPDB270-32-4-H

SS400

SM490A

Control de viruta excelente

### Resistencia al desgaste

- **Pieza de trabajo** Acero al Carbón (SS400)
- **Condiciones de corte** Diámetro del taladro (mm) =  $\varnothing 22$ , vc (m/min) = 65  
fn (mm/rev) = 0.25, ap (mm) = 30, con refrigerante
- **Herramientas** **Insertos** TPD220B-H (PC340Q)  
**Porta** TPDB220-25-4-H
- **Pieza de trabajo** Acero al Carbón (SM490A)
- **Condiciones de corte** Diámetro del taladro (mm) =  $\varnothing 27$ , vc (m/min) = 70  
fn (mm/rev) = 0.25, ap (mm) = 30, con refrigerante
- **Herramientas** **Insertos** TPD270B-H (PC340Q)  
**Porta** TPDB270-32-4-H

SS400

SM490A

### ■ Resultado de la prueba

Desgaste normal y en buenas condiciones para seguir usando

## 🔗 Sujeción de insertos TPDB-H

### Sujeción de inserto en portaherramientas

[imagen.1]

1. Coloque el inserto en el asiento de la punta del portaherramientas
2. Como se muestra en la [imagen 1], introduzca el inserto en la ranura con forma de v
3. Atornille para sujetar el inserto

### Cambio de inserto

[imagen.2]

[imagen.3]

1. Desatornille y separe el inserto usado del portaherramientas
2. Como se muestra en la [imagen 2], limpie la ranura donde se sujeta el inserto
3. Coloque un nuevo inserto en el asiento de la punta
4. Como se muestra en la [imagen 3], introduzca el inserto y atornillelo mientras lo sujeta con una mano para que no se separe del portaherramientas

## 🔗 Precauciones a considerar en taladrado

### Rampa

1. El ángulo de aproximación/entrada entre la broca y la pieza al comienzo del taladrado debe ser de menos de 6°.
2. Reduzca el avance a un 30-50% de las condiciones de corte recomendadas en el comienzo o final del mecanizado en pendiente.

### Planos superpuestos

1. El espacio limitado entre las láminas puede dificultar la evacuación de virutas dañando el cuerpo del taladro.
2. Sujete las láminas de manera que el espacio intermedio sea lo más reducido posible (idealmente no debería haber espacio).

### Taladrado en plunje

1. La carga mecánica irregular en mecanizado en plunje puede causar la fractura o deformación de la broca.

### Mandrinado

1. No se recomienda el mandrinado por el desgaste que se ocasiona en las esquinas de los insertos.

#### Grado de la Broca de Centro

## Como Sujetar las brocas

### Características de la broca de centro

- Conveniente y rápido ajuste de altura y sujeción de la broca de centro
- Si en el proceso de maquinado, se llega a fracturar o quebrar fácilmente se puede reemplazar
- El perno de ajuste cónico previene despostillamientos en la broca de centro

## Sujeción

| 1                             | 2                            | 3  | 4  | 5  |
|-------------------------------|------------------------------|--|--|--|
|                               |                              |  |  |  |
| Introduzca la Broca de centro | Apriete (Cartucho e inserto) | Ajuste la broca de centro con el tornillo cónico | Apriete fuertemente el perno de sujeción | Cerciórese de que los pernos estén debidamente apretados |

- ※ Sea cuidadoso con el filo de corte, se recomienda utilizar guantes y equipo de seguridad
- ※ Tenga cuidado con el disco, en caso de mecanizado en torneado

## Longitud de 'a' en la Broca de Centro

Si la longitud de 'a' es demasiado corto puede causar un mal acabado en la superficie o alta carga de corte. Por otro lado, si la longitud de 'a' es demasiado largo puede provocar fallas en la herramienta y traqueteo durante la perforación

| Diámetro (ØD) | Longitud de 'a' en la Broca de Centro |                   |                     |
|---------------|---------------------------------------|-------------------|---------------------|
|               | Acero                                 | Aleación de Acero | Metales No-Ferrosos |
| 25~30         | 1.2                                   | 1.0               | 1.5                 |
| 31~40         | 1.5                                   | 1.3               | 1.8                 |
| 41~50         | 1.8                                   | 1.5               | 2.2                 |
| 51~59         | 2.2                                   | 1.8               | 2.5                 |
| 60~75         | 2.5                                   | 2.0               | 2.8                 |
| 76~80         | 3.0                                   | 2.5               | 3.5                 |

## ⦿ Ajuste del Diámetro del Cartucho

- Desmontar un cartucho de la Broca aflojando el tornillo fijado para el cartucho exterior
- Maquinar después de calcular el tamaño del orificio con en el lado del cartucho exterior
- Corte la parte aguda después del mecanizado
- Coloque el tornillo de fijación del cartucho sin ningún espacio entre la broca y el cartucho exterior para el maquinado

### • Rango de diámetro de la broca ajustable

1. Tipo de cartucho individual (diámetro de perforación  $\varnothing 41 \sim \varnothing 59$ )  $\rightarrow -1.0\text{mm}$
2. Tipo de cartucho dual (diámetro de perforación  $\varnothing 60 \sim \varnothing 80$ )  $\rightarrow -5.0\text{mm}$

### • Diámetro de los taladros estándar está equipada con tamaño máximo de las normas

Ej) WPDC6570-40-6.5  $\rightarrow$  El diam. de la broca es de 70.0mm

Ej) Cómo ajustar el diámetro de perforación para  $\varnothing 66.0$  maquinado con WPDC6570-40-8

$\rightarrow$  Para hacer que el diámetro de la broca de cartucho exterior de 2.0 mm de la máquina, ( $\varnothing 70.0 \sim \varnothing 66.0 = 4 \rightarrow 4 \div 2 = 2$  (radio) )

### ➤ Características

#### Nuevo grado (PC325U)

- La capa de recubrimiento lubricante mejora la resistencia a la soldadura en condiciones de alta velocidad.
- Aumentar la resistencia al desgaste en el mecanizado de acero al carbono.

Resistencia al desgaste mejorada

PC325U

#### Superficie de la capa de recubrimiento

- Mayor resistencia a la adhesión (aporte por soldadura) y menor carga de corte
- Resistencia a la fricción reducida en los filos de corte y en la flauta

Superficie de revestimiento lisa

PC325U

Superficie de recubrimiento rugosa

Competidor

Lubricación mejorada

#### Control de viruta

- **pieza de trabajo** SCM440
- **Condiciones de corte** vc (m/min) = 90, fn (mm/rev) = 0.2  
ap (mm) = 30, con refrigerante
- **Herramientas** MSDPH060-5P (PC325U)

Virutas en buen estado

MSD Plus

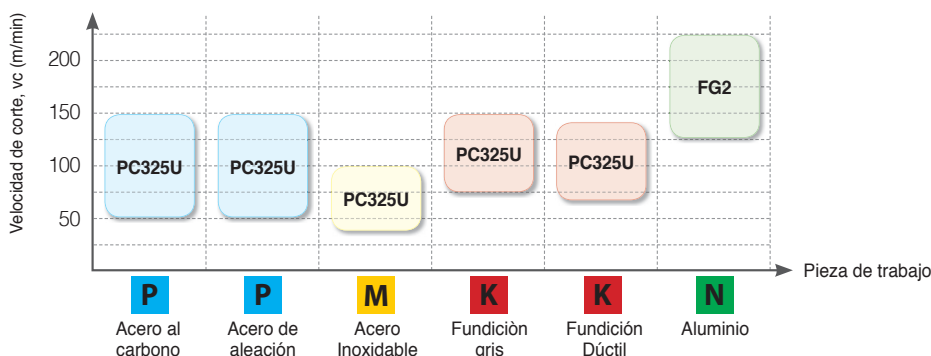

Competidor

#### Forma de la flauta

- Evacuación de viruta mejorada gracias a superficie de desalajo de viruta más ancho

### ➤ Área de aplicación

## Ejemplos de aplicación

- **Uso** parte del automóvil
- **Pieza de trabajo** SM45C
- **Condiciones de corte**  $vc$  (m/min) = 124,  $fn$  (mm/rev) = 0.15  
 $ap$  (mm) = 30, refrigerante interno
- **Herramientas** MSDP120-5P (PC325U)

MSD Plus

Competitor

### Resultado de la prueba

Capa de recubrimiento lubricante del nuevo grado PC325U maximiza la resistencia al desgaste.

- **Uso** parte del automóvil
- **Pieza de trabajo** SM53C
- **Condiciones de corte**  $vc$  (m/min) = 60,  $fn$  (mm/rev) = 0.25  
 $ap$  (mm) = 30, refrigeración externa
- **Herramientas** MSDP120-5P (PC325U)

### Resultado de la prueba

Brocas con recubrimiento especial para minimizar la resistencia generada por fricción

# G Información Técnica para Mach Solid Drill Plus-S

Broca especializada en aleaciones termorresistentes usados en las industrias aeroespacial, generación de energía y automotriz

## MSD Plus-S new

### Mach Solid Drill Plus-S

- Productividad mejorada y excelente maquinabilidad: garantizamos una mejor maquinabilidad gracias al diseño optimizado de los filos de corte y los canales
- Resistencia al desgaste mejorada: mayor vida útil debido a la excelente resistencia al astillado en mecanizado a altas temperaturas

#### ➤ Sistema de código

#### ➤ Características

- Filo de corte diseñado para controlar la aparición de la muesca en filo. Tratamiento especial para prevenir el astillado y la rotura
- Margen optimizado y canales con reducción interna

- ① Filos diseñados para disminuir la resistencia de corte
- ② Ángulo de incidencia en punta y forma optimizada para evacuación de calor

- ① Resistencia a la fricción y temperatura de corte reducida
- ② Canales anchos para una buena evacuación de viruta

- Grado PC325T: mejorando la resistencia al calor y a la oxidación
- Resistencia a la fricción reducida y mejorada la evacuación de viruta gracias al excelente acabado superficial
- Excepcional resistencia al desgaste al mecanizar aleaciones resistentes al calor a altas temperaturas.

PC325T

Superficie del recubrimiento lisa

## Evaluación de desempeño

- **Pieza de trabajo** Inconel718 (HRC40~45)
- **Condiciones de corte** Diámetro del taladro (mm) = Ø10, vc (m/min) = 20, fn (mm/rev) = 0.09, ap (mm) = 30, con refrigerante
- **Herramientas** MSDPH100-5S (PC325T)

- **Pieza de trabajo** Ti-6Al-4V (HRC42~47)
- **Condiciones de corte** Diámetro del taladro (mm) = Ø10, vc (m/min) = 40, fn (mm/rev) = 0.09, ap (mm) = 30, con refrigerante
- **Herramientas** MSDPH100-5S (PC325T)

## Cadena de eslabones de arbusto

- **Uso** Partes y componentes industria aeroespacial (turbinas, álabes, ejes de turbina, etc.) y componentes utilizados en la industria de generación de energía.
- **Pieza de trabajo** Inconel718 (HRC40~45)
- **Condiciones de corte** Diámetro del taladro (mm) = Ø6.0, vc (m/min) = 20, fn (mm/rev) = 0.09, ap (mm) = 30, con refrigerante
- **Herramientas** MSDPH060-5S

- **Uso** Partes y componentes industria aeroespacial (partes motores de reacción, turbinas, álabes, etc.) y componentes utilizados en la industria de generación de energía.
- **Pieza de trabajo** Ti-6Al-4V (HRC42~47)
- **Condiciones de corte** Diámetro del taladro (mm) = Ø6.0, vc (m/min) = 40, fn (mm/rev) = 0.09, ap (mm) = 30, con refrigerante
- **Herramientas** MSDPH060-5S

## Condiciones de Corte Recomendadas

# G Información Técnica para Mach Solid Drill Plus CFRP

Herramienta optimizada para la fabricación de agujeros de polímero de fibra de carbono reforzada CFRP

## MSD Plus CFRP **new**

### Mach Solid Drill Plus para Mecanizado CFRP

- Excelente resistencia al desgaste gracias al nuevo grado con recubrimiento de diamante, ND2100
- Reducción de rebabas al mecanizar CFRP gracias a bordes de corte positivos

#### ➤ Sistema de Codificación

#### ➤ Características

- El filo con forma de 2 pasos reduce la carga de corte
- El ángulo óptimo de punta del filo reduce las rebabas
- Alta dureza del filo aumenta la resistencia al desgaste

ND2100

- Recubrimiento diamantado especializado en mecanizado CFRP
- Sustrato recubierto de diamante optimizado para corte CFRP

Recubrimiento de diamante de alta dureza; manteniendo una forma en buen estado

El fuerte adhesión del recubrimiento de diamante al sustrato

- Reducción de la formación rebabas al mantener los filos en mejor forma

Desconchado inhibido

Menos desgaste y descamado en la superficie del filo

Menos rebabas en las piezas

## Evaluación de desempeño

- **Pieza de trabajo** CFRP
- **Condiciones de corte**  $vc$  (m/min) = 100,  $fn$  (mm/rev) = 0.05,  $ap$  (mm) = 10, Aire
- **Longitud de corte** 7.2m (720 agujeros)
- **Herramientas** MSDP060-5C (ND2100)

Calidad de rendimiento mejorada

- **Pieza de trabajo** CFRP
- **Condiciones de corte**  $vc$  (m/min) = 100,  $fn$  (mm/rev) = 0.05,  $ap$  (mm) = 10, Aire
- **Longitud de corte** 7.2m (720 agujeros)
- **Herramientas** MSDP060-5C (ND2100)

Mejor maquinabilidad en la fabricación de perforaciones de alta calidad

## Ejemplos de aplicación

- **Uso** la cola del ala
- **Pieza de trabajo** CFRP
- **Condiciones de corte**  $vc$  (m/min) = 100,  $fn$  (mm/rev) = 0.05,  $ap$  (mm) = 10, Aire
- **Herramientas** MSDP060-5C (ND2100)

### Resultado de la prueba

## Condiciones de Corte Recomendadas

La mejor herramienta para piezas de trabajo en rampa, curvas o planas

**MSFD** *new*

## Mach Solid Flat Drill

- Capacidad de fabricación de perforaciones de alta calidad con ángulo de 180°
- Mejora de la resistencia al astillamiento y adhesión por soldadura mediante el afilado y biselado de bordes
- Formación mínima de rebabas en comparación con los taladros generales

### ➤ Sistema de codificación

### ➤ Características

- Excelente rectitud con su ángulo de 180° cuando se perfora en una superficie en rampa
- Mayor resistencia al astillado gracias a chaflán en el vértice
- Salidas de viruta ampliadas mediante el uso de la forma 'R' en la parte que se angosta

- Capacidad multifuncional: fresado y taladrado con solo MSFD

## Amplias aplicaciones

- Una amplia gama de aplicaciones y un rendimiento de corte mejorado

## Evaluación de desempeño

- Pieza de trabajo** SM48C
- Condiciones de corte**  $vc$  (m/min) = 80,  $fn$  (mm/min) = 0.10,  $ap$  (mm) = 15, con refrigerante
- Longitud de corte** 7.2m (600 perforaciones)
- Herramientas** MSFD060-2P (PC325U)

**MSFD**

prolonga la vida útil de la herramienta

Competidor

- Pieza de trabajo** SM45C
- Condiciones de corte**  $vc$  (m/min) = 70,  $fn$  (mm/min) = 0.10,  $ap$  (mm) = 15, con refrigerante
- Herramientas** MSDPH060-3P (PC325U)

**MSFD (presión promedio de 160N)**

Consistencia en la estabilidad del tamaño de la perforación y mejor acabado de la superficie

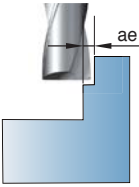

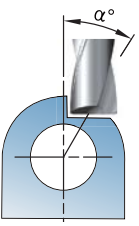

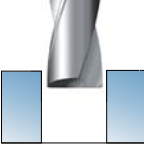

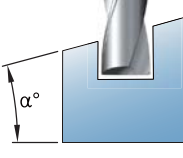

Competidor (presión promedio de 214N)

## Rango de aplicación

## Ejemplos de aplicación

- **Pieza de trabajo** acero al carbono (SM45C)
- **Condiciones de corte**
  - vc (m/min) = 80
  - fn (mm/min) = 0.1
  - ap (mm) = 12, con refrigerante
- **Herramientas** MSFD060-2P (PC325U)

### Resultado de la prueba

- **Pieza de trabajo** acero de aleación (SCM440)
- **Condiciones de corte**
  - vc (m/min) = 100
  - fn (mm/min) = 0.1
  - ap (mm) = 14, con refrigerante
- **Herramientas** MSFDH060-3P (PC325U)

# G Información Técnica para Mach Long Solid Drill Plus

Resultados de alta precisión al mecanizar perforaciones profundas

## MLD Plus new

### Mach Long Solid Drill Plus

#### ↻ Sistema de codificación

Tipo especial

MLD 0600N - 10 P - 100L - 10S

#### ↻ Características

##### Forma de filo y flauta

- El filo recto proporciona una mejor rigidez
- Excelente evacuación de viruta debido a una salida de viruta más ancha y menor rugosidad de la superficie de la flauta
- Doble borde en el filo asegura la estabilidad de mecanizado

##### Nuevo grado (PC315G)

- Sustrato ultrafino y nuevo recubrimiento aplicado
- La capa de recubrimiento lubricante mejora la evacuación de viruta con menor resistencia por fricción
- Mayor vida útil de la herramienta debido a una mayor resistencia al desgaste

PC315G

##### Grado de mecanizado de precisión

- Mejora de la precisión de mecanizado
  - Se redujeron las curvaturas en las perforaciones, se mejoró la rugosidad de la superficie interior de la perforación
  - Aumento de la uniformidad del tamaño de la perforación
- Forma de punto mejorada
- Ubicación precisa de corte asegurada

Reducción de perforaciones dobladas en comparación con los competidores (a > b)

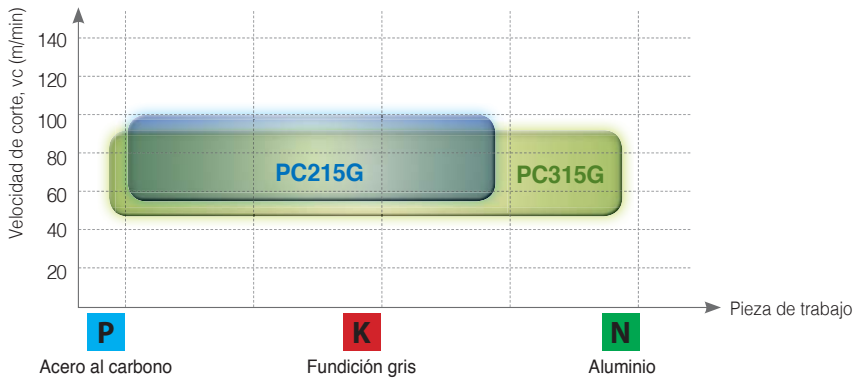

##### Carga de corte

- **Pieza de trabajo** SM45C
- **Condiciones de corte** Diámetro del taladro. (m) = Ø6.0, vc (m/min) = 70  
fn (mm/rev) = 0.12, ap (mm) = 60, con refrigerante
- **Herramientas** MLD0600N-20P

## Área de aplicación

- **PC215G** – excelente rendimiento en el mecanizado de fundición y acero aleado a alta velocidad
- **PC315G** – grado universal excelente para el mecanizado de acero al carbono, hierro fundido, etc. a una velocidad de corte media a baja

## Ejemplos de aplicación

- **Uso** parte del automóvil
- **Pieza de trabajo** SM45C
- **Condiciones de corte** vc (m/min) = 70, fn (mm/rev) = 0.12, ap (mm) = 60, refrigerante interior
- **Herramientas** MLD0400N-20P (PC315G)

### Resultado de la prueba

- **Uso** parte del automóvil
- **Pieza de trabajo** SCM440H
- **Condiciones de corte** vc (m/min) = 70, fn (mm/rev) = 0.12, ap (mm) = 55, refrigerante interior
- **Herramientas** MLD0507N-15P (PC315G)

### Resultado de la prueba

## Condiciones de corte recomendadas

Alto avance y precisión del maquinado por su diseño especial en la punta

## Vulcan Drill

- Disponibles para alto avance y maquinados precisos por su especial diseñada punta
- Las Brocas Vulcan aseguran una larga vida bajo las altas condiciones de velocidad, debido al incremento térmico y resistencia al desgaste. También utiliza una reducida resistencia a la fricción por adoptar un recubrimiento PVD con un exclusivo substrato para ayudar a mantener estas condiciones
- Baja resistencia al corte por el mejor diseño del ángulo de despegue es posible incrementar el avance
- Suave control de virutas debido a el mejoramiento del la rompeviruta
- Rmax: 6~25s, Tolerancia de el barreno: IT8 ~ 10
- Fuerte resistencia al impacto le asegura una larga vida a las herramientas aun bajo un alto nivel de uso

### ➤ Sistema de Codificación

### ➤ Aplicación para vulcan drill

- Aceros, Aleaciones de acero, acero dulce, acero inoxidable, hierro forjado, hierro forjado dúctil, metales no ferrosos, etc

### ➤ Aviso

- **Perforaciones Inadecuadas**
  - Evite la inclinación y el desnivel al iniciar la perforación
  - Reduzca el avance 0.1~0.15mm/rev cuando perfore inclinado y en desnivel
- **Sujeción de pieza de trabajo**
  - En caso de un panel abierto que pudiera rotar por un componente horizontal, brinde primeramente estos materiales para prevenir pandeo en la parte central de la pieza de trabajo para una mejor eficiencia

Broca enteriza económica

# ESD Plus **new**

## Eco Solid Drill Plus (Broca enteriza económica)

- Excelente relación calidad-precio: excelente rendimiento y eficiencia de gasto.
- Resistencia al desgaste mejorada: buena resistencia gracias al recubrimiento de nuestra nueva calidad PC325U

### ➤ Características

#### Nuevo grado (PC325U)

- Recubrimiento lubricativo que mejora la resistencia al filo de aportación en velocidades medias y altas
- Mejora la resistencia al desgaste en mecanizado de acero al carbono

PC325U

Resistencia al desgaste mejorada

#### Superficie de la capa de recubrimiento

- Excelente resistencia a la aportación o soldadura de material en el filo de corte y baja carga de corte
- Reduce la fricción en los filos de corte y los canales

PC325U

Lubricación mejorada

Competidor

#### Control de viruta

- **pieza de trabajo** SCM440
- **Condiciones de corte** vc (m/min) = 40  
fn (mm/rev) = 0.1, ap (mm) = 30, wet
- **Herramientas** ESDP060-5P

ESD Plus

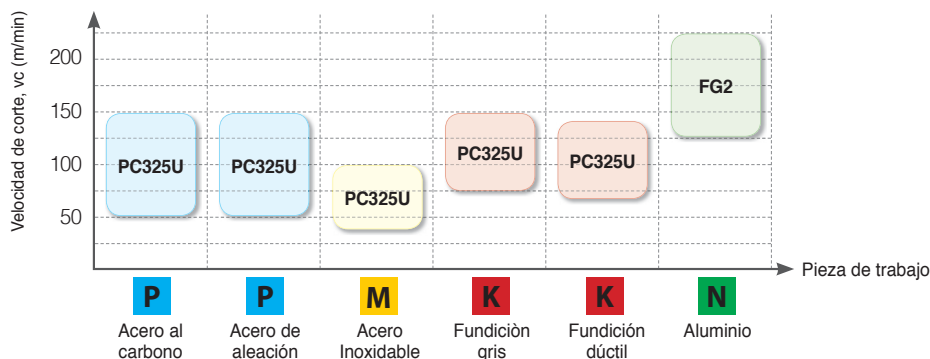

Competidor

#### Forma de los canales

- Evacuación de viruta mejorada gracias a la anchura de los canales

### ➤ Área de aplicación

## Evaluación de desempeño

- **Pieza de trabajo** Aleación de Acero (SCM440)
- **Condiciones de corte**  $vc$  (m/min) = 95,  $fn$  (mm/rev) = 0.12  
 $ap$  (mm) = 20, con refrigeración externa
- **Herramientas** ESDP060-5P

ESD Plus

Competitor

### Resultado de la prueba

Recubrimiento de alta lubricación del grado PC325U maximiza la resistencia al desgaste

## Cadena de eslabones de arbusto

- **Pieza de trabajo** Acero al Carbon (SM45C)
- **Condiciones de corte**  $vc$  (m/min) = 50,  $fn$  (mm/rev) = 0.08  
 $ap$  (mm) = 23.5, refrigeración externa
- **Herramientas** ESDP090-5P

### Resultado de la prueba

Superficie del recubrimiento tratada especialmente, minimiza la resistencia a la fricción

# G Información Técnica para Carbide Drill (SSDP)

Broca sólida de alto rendimiento

## SSD Plus **new**

- Control de viruta mejorado gracias al nuevo diseño de los canales
- Se logra un mecanizado de mayor calidad a partir de un mejor acabado superficial
- Mayor productividad gracias a una vida útil estable de la herramienta
- Variedad de materiales de trabajo a mecanizar, incluyendo acero suave y materiales no ferrosos

※ Código para encargo: TSDM125

Alta precisión en el maquinado de agujeros en aleación de aluminio

# PCD Drill

- Alta precisión en el maquinado de agujeros en aleación de aluminio
- Tolerancia de perforación: IT7~8class
- Recomendada para gran precisión y maquinado

## ➤ Sistema de Codificación

Cantidad estable, debido al único filo de corte, Reafilado disponible

## Gun Drill

- Alta eficiencia en maquinados de agujeros profundos
- Alta precisión (Tolerancia en el Agujero: iT9, Superficie de Acabado: Ra0.1~3.0s)
- Cantidad estable, debido al único filo de corte, Reafilado disponible
- Taladro usado puede reciclarse como parte de cambio de carburo
- Dependiendo de la petición, las brocas pueden cambiar de geometría del filo de corte y especificación de la unidad
- Para pedios especiales, favor de checar el largo de la broca

| <b>Aplicación</b>                | Para Todo tipo de Maquinado | <ul style="list-style-type: none"> <li>• Piezas de trabajo con una buena evacuación de la viruta</li> <li>• Maquinado de a mayor avance que los tipos de un solo labio</li> </ul> |

- Consulte el sistema de codificación y el dibujo de arriba con el pedido
- Consulte la página 112 para el tamaño del Mango
- Longitud total de la broca: puede ser escogida según pedido

**Aplicación de Gun Drill en maquinado Exclusivo**

• El casquillo guía es necesario para centrar la gun drill

**Aplicación de Gun Drill en Centro de Maquinados**

**1 Maquinado de un agujero piloto**

1. Un agujero piloto es necesario en el maquinado en un centro de maquinado en vez de un casquillo de guía
2. El diámetro del agujero piloto debe ser 0,01 ~ 0,02 (H7) más grande más grande que un diámetro de la Gun Drill y la profundidad de perforación debe ser de aproximadamente 2,5 x D
3. El uso de Mach Drill (MSD) para el maquinado de un agujero piloto

MSD

**2 Moviendo la Gun drill al agujero piloto**

1. La Gun Drill no debe perforar antes de entrar en el agujero piloto
2. El refrigerante es necesario para la perforación

**3 Inicio del Barrenado**

1. Rote el eje
2. Máquina con perforación de eje vertical

**4 Después del Barrenado**

1. Regrese el taladro
2. Detener la perforación y el suministro de refrigerante
3. Retire la Gun drill

## Información Técnica

Los siguientes factores determinan la rectitud del agujero

- Diámetro de la broca y profundidad de la perforación
- Condición de corte y tipo de aplicación
- Tipo de pieza de trabajo y máquina
- Guía de Taladro

**Poder de maquinado requerido**

**Rectitud**

**Cantidad de Refrigerante**

**Presión del refrigerante**

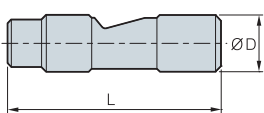

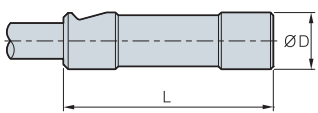

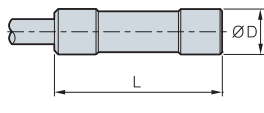

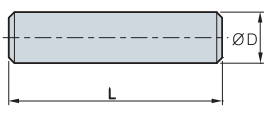

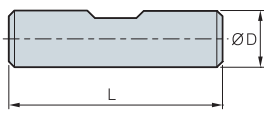

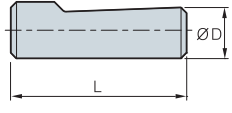

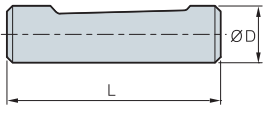

El gráfico anterior muestra la información general y es variable en función de tipo de herramientas, piezas, condiciones de corte, etc

- **Presión y la cantidad de líquido refrigerante** - La alta presión del refrigerante garantiza una excelente evacuación de viruta y el enfriamiento del filo de corte
- **Use un filtro para eliminar impurezas** - El diámetro de un filtro debe ser inferior a 20  $\mu\text{m}$ . Las impurezas pueden hacer que un mal flujo de refrigerante, desgaste de una herramienta, y carga excesiva en la bomba de refrigerante
- **La temperatura del refrigerante** - Temperatura adecuada del líquido: 20°C~22°C/No utilice refrigerante superior a 50°C

**Tipos de Mangos**

Para producción masiva y de alto rendimiento

## Indexable Reamer

- Conveniente para la producción masiva y de alto rendimiento
- Uso de PCD o inserto revestimiento para un maquinado de alta velocidad
- Excelente alta precisión y hoyos Maquinado ajustable
- Usando el sistema de sujeción de precisión (hidráulica, rotación, etc.)
- Uso de refrigerante interno para evacuar las virutas
- Utilizando soporte adecuado e inserción
- Para ajuste de los insertos, use el ajustador (KIRSD-210)

### ➤ Aplicación

Maquinado a lo largo de la pieza (tipo IRT)

Maquinado de Agujero Ciego (tipo IRB)

## ➤ Como instalar el inserto

1. Atornille el tornillo en contra de cuña hacia la derecha con la exclusiva llave

2. Atornille el tornillo de fijación  
 ① Parte superior: hacia la izquierda  
 ② parte inferior: a la derecha

3. Remueva el inserto y limpie la cavidad

4. Coloque la pieza hasta el tope de borde y sujetar la pieza  
 ① Parte superior: hacia la derecha  
 ② parte inferior: la izquierda

## ➤ Accesorio Exclusivo

- Código: KIRSD-210
- Diámetro máximo de la rima:  $\varnothing 60 \times 210$  mm
- El aparato también está disponible para configurar rimas especiales y herramienta de mono
- Rimas especiales (fuera del rango de ajuste máximo) están disponibles para cotización

## ➤ Cómo configurar un inserto con el accesorio

• Ajuste el medidor hasta 0

• Girar la rima para que el inserto toque el medidor

• Ajuste el cono hacia atrás y ajuste la altura del inserto con el tornillo de cuña  
 ① Parte superior de inserto: 0,015 ~ 0,020mm  
 ② Parte inferior lateral del inserto: 0,005 ~ 0,010mm  
 ③ conicidad: 0,010 ~ 0,015mm

## ➤ Conicidad

- Asegura baja carga de corte y un excelente acabado superficial con la evacuación de la viruta
- Conicidad incorrecta podría causar inestabilidad en el maquinado y desgaste en el inserto
- El tamaño de la conicidad del inserto debe ser menor a 0,010 ~ 0,015 mm que la parte superior del inserto

## ➤ Ajuste del inserto con micrómetro

• Torno con dos centros o en un banco de centro están también disponibles

**Aviso:** La configuración con un micrómetro, no se recomienda debido al despostillamiento del filo de corte

## Cermet Reamer

- La rama de cermet realiza el mayor rendimiento en el mecanizado de acero de alta dureza (Menor rendimiento en el mecanizado de fundición)
- Alta maquinabilidad y resistencia al desgaste extiende la vida útil
- Alta productividad más de 30%, buen acabado en superficie, mayor vida útil que la rama de carbono

### ➤ Sistema de Codificación

# Broach Reamer

- Óptimo para mecanizado de orificios pasantes de alta precisión con una larga vida útil de la herramienta
- Con ángulo de hélice alto (45 grados) que mejora la mecanizabilidad
- Rugosidad superficial superior y alta precisión
- Filo de corte fuerte y excelente evacuación de virutas
- Dia. Ø3.0~Ø25.0

## KORLOY Grado Ultrafino: Serie F

### Características

En general, cuando comparamos carburo-cementado con acero de alta velocidad, el carburo-cementado tiene mayor dureza pero es más frágil que el acero de alta velocidad. Para neutralizar la diferencia de nuestro carburo-cementado, KORLOY ha desarrollado un ultra fino carburo-cementado grado "F-Series"± (WC tamaño menor a 0.5µm). Su calidad es mejor en dureza y resistencia a deformaciones plásticas contra el carburo cementado, que tiene teniendo granos de tamaños superior. La mayor cobertura de la capa ultra fina de carburo-cementado se utiliza principalmente en aceros templados con aleaciones

#### Micro estructura de "F-Series"

Desde que los grados se enfocaron en dureza, es posible hacerit iendmill, cortadores laterales, borcas gun, reamer etc. Tiene una Superior calidad en dureza y anti-crecimiento apropiado

Ha sido modificadode el FA1 para incrementar ela resistencia a el shock termalo, el FCC tiene propiedades propias para el acero inoxidable y materiales difíciles de maquinar con baja y alta v

Como un grado ultra fino tiene grand dureza y superior resistencia a el mismo tiempo, es la primera recomendacion en grado de KORLOY para un filo mas vivo en materiales difíciles de cortar

### Mejoramiento de corte

#### Características especiales

| Grado | Características     |              |               | ISO clasificación | Resistencia a el desgaste | resistencia |
|-------|---------------------|--------------|---------------|-------------------|---------------------------|-------------|
|       | Gravedad específica | Dureza (HvA) | TRS (kgf/mm²) |                   |                           |             |
| FS1   | 14.4                | 92.4         | 250           | Z10               | ⊙                         | ○           |

#### Resistencia a rebabeo

| Grado ultra fino | Longitud (m) | Ranurado       | Estado    |
|------------------|--------------|----------------|-----------|
| Carburo G10      | 0.96 m       | (2.5 ranurado) | Astillado |
| Carburo H01      | 1.54 m       | (4 ranurado)   | Astillado |
| Acero rápido     | 2.55 m       | (6.7 ranurado) | Astillado |

Long de corte: 0, 5, 10, 15, 20, 25  
 Veces de corte: 0, 20, 40, 60

Material: 4140 (AISI) · herra. Endmill carburo solidio I (Ø8 mm, 2canales)  
 vc = 26.5 m/min, fz = 0.0285 mm/t, vf = 60 mm/min, conrefrigeración

#### Resistencia a el desgaste

### Guia de seleccion de grados

|               |                                      |
|---------------|--------------------------------------|
| material      | Acero Metales no ferrosos, h forjado |
| recomendacion | FS1, FG2, FCC, FA1                   |
| herramienta   | Drill, Endmill                       |

- Material: SM55C (HRC20)
- Angulo de helice: 30°
- Herramienta: Ø10 mm, 2 labios (SSE2100)
- RPM = 1,100 min<sup>-1</sup>
- Velocidad de corte = 35 m/mim
- Profundidad de eje = 12 mm
- Avance = 0.1 mm/t
- Profundidad radial = 1 mm
- Corte hacia abajo, sin refrigerante

## Pruebas de Corrosión y Magnetismo: Serie IN

### Características

- Sobresaliente resistencia a la corrosión: ciento de veces mejor que el grado general de carburo. (Se realizaron las pruebas al 30%  $\text{NH}_3$ , comparándolo con KORLOY G5 y IN-Series)
- Excelente dureza y resistencia: sobre (HRA) 85 dureza, sobre (TRS) 200 resistencia
- Varios grados: 3 diferentes tipos de grados para cada específica operación, respectivamente

| Grado | Grav.especifica (g/cm <sup>3</sup> ) | Dureza (HRA) | TRS (kgf/mm <sup>2</sup> ) | Saturación magnética Gauss (Gauss · cm <sup>3</sup> /g) | Uso   |
|-------|--------------------------------------|--------------|----------------------------|---|---|
| IN10  | 14.4                                 | 91.5         | 230                        | 0   | Acero p. maquina, aleaciones anticorrosivas, aleaciones en contra de magnetismo |
| IN20  | 14.5                                 | 91.0         | 230                        | 90  | Acero p. maquina, aleaciones anticorrosivas                                     |
| IN40  | 13.5                                 | 85.5         | 230                        | 0   | Moldes para polvo magnetico. Anticorrosivo alea. Contra magnetismo              |

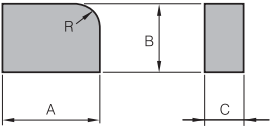

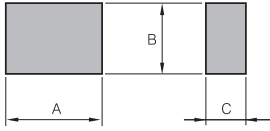

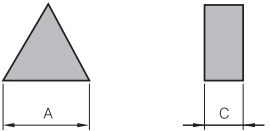

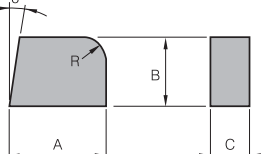

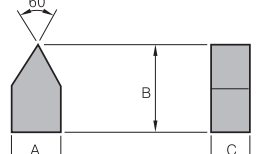

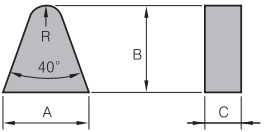

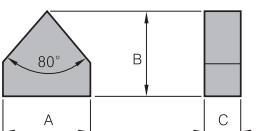

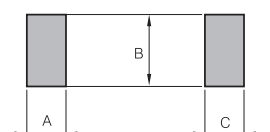

### Microestructura de la serie IN

# Chuck Jaw **new**

## Características

- Chuck Jaw abraza pieza de trabajo en bruto fuertemente en torneado y fresado (Incluyendo MCT)
- Puede tirar cualquier tipo de pieza de trabajo

## Información de existencias

| Código | Geometría   | Dimensiones  |

# H Tipos de Cortadores Cementados

## Características

- Para varias aplicaciones
- Exactitud precisa. Fácil para orden especiales
- Conveniente para las pequeñas maquinas. Plazos de entrega cortos
- Costos razonables de la herramienta. Reutilizable después de afilar

## Proceso de Corte

## Procesos y Tipos de Corte

# Serie DBT

Para maquinados a alta velocidad

## Serie DBT

Sistema restringido de 2 caras de cara cónica y de vástago para una excelente rugosidad de la superficie y un acabado de alta calidad en cortes pesados a alta velocidad

### ➤ Sistema restringido de 2 caras: características

- Maquinado estable a alta velocidad
- Mejorada vida de la herramienta para máquinas de eje y herramienta de corte
- Prevención de la corrosión de porsion cono de husillo de la máquina y soporte de la herramienta por la vibración pesada del maquinado
- Garantizado para el maquinado más adecuado y de alta precisión

### ➤ Tipo BT

Brecha entre la sección transversal de un cabezal y un vástago  
-La misma condición de sujeción que en un vástago de sujeción BT

### ➤ Tipo DBT

No hay brecha entre la sección transversal de un cabezal y un vástago  
- mejor rugosidad superficial/mecanismo mejorado/ menos cracterización

### ➤ Mayor estabilidad y precisión

La estabilidad y la precisión aumentan debido al contacto cercano entre la cara cónica y el diámetro externo ancho de la brida en el vástago con husillo DBT que en el vástago BT

| Porta | Cónico | Brida |
|-------|--------|-------|
| BT30  | Ø31.7  | Ø46   |
| BT40  | Ø44.4  | Ø63   |
| BT50  | Ø69.8  | Ø100  |

Diferencia entre la cara de contacto lateral y el diámetro externo

### ➤ Varios modelos

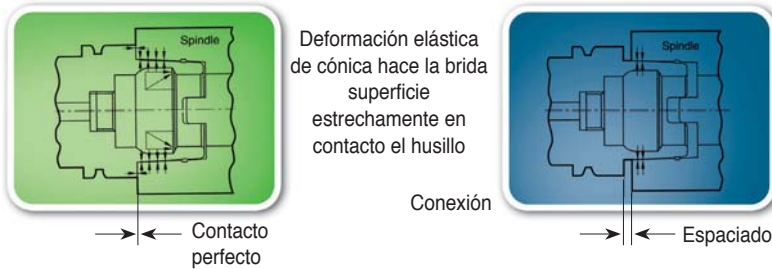

| Para machos de roscar   | Para fresado  | Para fresado con fresa insertable  | Cabeza Angular  |

# Herramientas con Sistema HSK

## Ventajas de los adaptadores HSK con presión en dos fases

El vástago cónico 7/24 para usos múltiples se ha señalado que su rendimiento es inadecuado en términos de repetibilidad, Rigidez conjunta y mecanizado a alta velocidad. Los inconvenientes de 7/24 vástagos cónicos se habían eliminado mediante el uso de dos nuevos contactos frontales

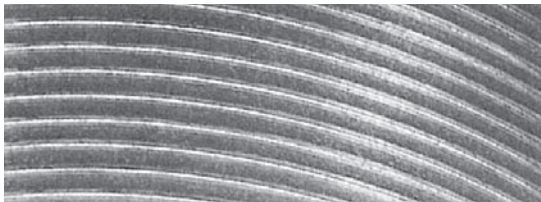

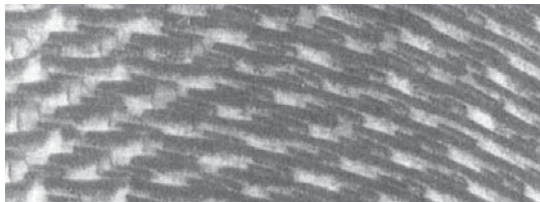

Sistema HSK - sistema de contacto perfecto en dos superficies

## Excelente precisión de repetición y agotamiento

Como el cono del soporte se deformará elásticamente siguiendo el perfil de la forma del husillo, no hay excentricidad entre husillo y el otro. Además, debido al contacto perfecto entre la superficie de la brida del soporte y la cara del husillo, se dobla La resistencia del soporte es muy alta, lo que hace que la precisión radial y axial sea muy alta.

## Alta rigidez frente a la carga de flexión

| HSK 63  | BT 40  |
|---|--|
|  |  |

## Sistema de balanceo

### ⦿ Desequilibrio

#### • Causa de desequilibrio

El desequilibrio se produce debido a la asimetría de las geometrías de las herramientas y desgaste del husillo

#### • Dificultades de desequilibrio

La vida útil de la herramienta es más corta, la rugosidad de la superficie inferior y el ruido son causados por Vibración durante la rotación y daños en el rodamiento del husillo.

#### • Necesidad de equilibrar

Es necesario equilibrar para evitar el desequilibrio para una mejor rugosidad de la superficie, precisión y vida útil de la herramienta

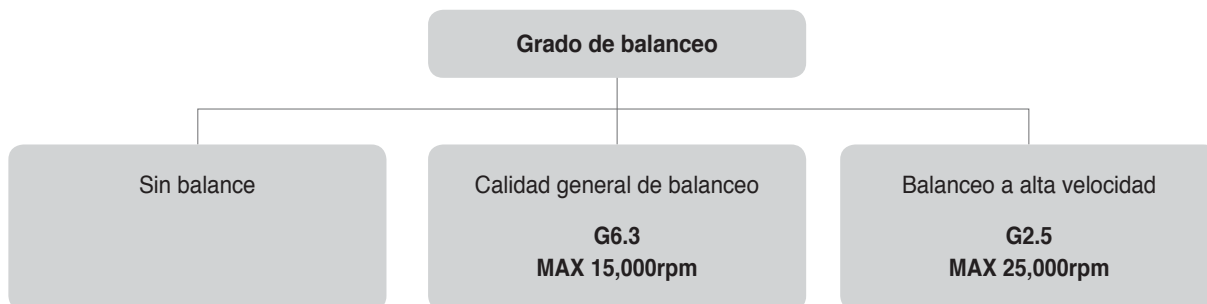

※ Un caso en el que el centro de gravedad de la herramienta. se desvía del eje de rotación

### ⦿ La precisión óptima a alta velocidad

- Sin flexión de la rotación debido a la carga balanceada, de alta precisión y rigidez se mantienen mucho tiempo.
- Balance Excelente ( $\leq G1.0$  ó  $0.5 \text{ g}\cdot\text{mm}/\text{kg}$ )
- Excelente vida de la herramienta, el acabado superficial, la dimensión de la precisión y la productividad se puede realizar a gran velocidad.

### ⦿ Grado de balanceo estándar

Distintas opciones de balanceo disponibles

## Serie DHE

El Chuck hidráulico para el mecanizado de mayor precisión debido a alta precisión y alta fuerza de abrazar

# Serie DHE

- Diferentes aplicaciones: maquinado de moldes, partes de automóviles, piezas de precisión, etc
- Con una gran durabilidad, precisión y fuerza de cierre, no se cambian por un largo tiempo
- Elevada fuerz de fijación permite un maquinado estable sin fluctuaciones en la fuerza de sujeción

### ➤ Sistema de codificación

### ➤ Características

Su alta precisión alarga la vida útil de la herramienta debido a un menor desgaste y la cámara hidráulica aumenta la rugosidad superficial al disminuir las vibraciones

- Excentricidad: menos de 5  $\mu\text{m}$
- $L = 3 \times \text{ØD}$
- Mango: Tolerancia de  $\text{ØD}: h6$

### ➤ Estructura de sellado interno (Durabilidad)

- El sistema de sellado interno evita que el polvo, aceite de corte, lubricantes y virutas penetren en el portaherramientas
- Mantiene la fuerza de fijación y la precisión durante largo tiempo long time

### ➤ Su estructura de sujeción facilita la operación (Conveniente)

- Se puede cambiar fácilmente la herramienta con una llave de tuercas con mango en T
- Reduce la fatiga del trabajador
- Mejora la capacidad de la máquina

### ➤ Agarre estable

El espacio entre el soporte y la herramienta se fija por presión hidráulica

El diseño compacto de Chuck de encogimiento para ultra alta velocidad y alta precisión

## DSC

- Uso de acero especialmente tratado al calor.
- Mecanizado y sujeción de alta precisión.
- Mayor precisión y mayor vida útil de la herramienta debido a un voladizo minimizado al mecanizar ranuras profundas
- Diámetro de vástago aplicable: Ø3-Ø32

### Sistema de codificación

### Tipo mono curvo

- DSC integral con alta precisión y balanceo
- Diseño largo pero estable

### Alta fuerza de corte

- Fuerza de amarre un 30% más fuerte
- Excentricidad ( $\leq 0.003$  mm)
- Alto poder de transmisión de la fuerza de amarre por el círculo interno

### Diseño simétrico

- Alta fuerza de amarre

#### Adaptador por encogimiento

Fijar la holgura entre el soporte y Herramienta por contracción térmica.

#### Adaptador con boquilla

Fijar la herramienta por elasticidad de pinza.

Champion milling chuck

# CPM

- Mejora la vida útil de la herramienta al bloquear el polvo y las fugas de lubricante Con perfecta estructura de sellado en junta tórica y tuerca.
- Disponible a través del sistema de refrigerante con juego de CTC
- RegulaEl regulador de longitud está insertado en el CPM, el usuario puede ajustar la longitud convenientemente

➤ Sistema de codificación

➤ Prevención de fugas de grasa y polvo.

CPM tiene una junta tórica en las tuercas para absorber la vibración de corte para Operación estable y evita la entrada de escombros.

Contacto facial para maquinado estable y prueba de polvo.

➤ Correlación de fugas de aceite y vida útil de la herramienta

Aumento evidente de la vida útil de la herramienta después de aplicar el sistema a prueba de polvo.

O-Ring: Bloquea lubricante y el polvo → Aumento vida herramienta

• Conjuntos disponibles por encargo • Sistema de lubricación interno es opcional

Portaherramientas de fresado para corte medio con durabilidad mejorada debido a su gran sujeción y a la prevención del polvo

# NPM

- Sujeción fuerte de más de 500kgfm (En base NPM42)
- Funcion DUST BLOCK para bloqueo de sustancias nocivas
- refrigerante Jet disponible
- Precision Alta precisión dentro de 15 a L / D = 3
- Diámetro de vástago aplicable: D6-42

## ➤ Sistema de codificación

## ➤ Mejorada durabilidad, su diseño evita el ingreso de polvo, virutas, etc

- Anillo de retención en la apertura de la boquilla
- evitando que el polvo y las virutas se introduzcan en el adaptador

- Cojinete de acero de diseño especial para evitar roturas
- Sujeción fuerte mediante propagación de la fuerza

## ➤ Mecanizado estable desde pesado a fino

Un contacto frontal perfecto y su gran fuerza de sujeción intensifican la fuerza de corte y la absorción de vibraciones

Para mecanizado desde fresado pesado a acabado fino

# Serie Collet Chuck

- Alta precisión y gran fuerza de cierre
- Conveniente para el cambio de herramienta
- Diversidad de modelos
- Diametro del Chuck  $\text{Ø}1.0\sim\text{Ø}26.0\text{mm}$

## Series Collet Chuck

## Pinza de alta precisión

- Tipo precisión:  $5\ \mu\text{m}$  (GER-B)
- Tipo alta precisión:  $2\ \mu\text{m}$  (GER-HP)
- Tipo refrigeración interior

- Tipo precisión
- Tipo alta precisión

- Tipo refrigeración interior

Portapinzas ER

# SDC/P

- Adaptador boquilla ER, tipo estandar para maquinado general
- Diámetros aplicables: Ø1.0~Ø26.0

➤ **Boquilla de primera clase (Hecha en Suiza 🇨🇭)**

Boquillas de fácil acoplaje

Herramientas endurecidas con tratamiento especial

For SDC/P  
(Para maquinado general)

**Boquilla para alta velocidad**

# DSK

- Disponible para maquinado a max.15,000 RPM y balanceo de G6.3
- Vibración de la herramienta minimizada durante el funcionamiento utilizando una boquilla 8°
- La tuerca de alta precisión hecha en suiza mejora la estabilidad
- Diámetro de vástago aplicable: Ø1.8~Ø25

**Adaptador fino de super velocidad**

# GSK

- Disponible para maquinado a max.25,000 RPM y balanceo de G6.3
- Mayor productividad gracias al mecanizado de alta velocidad.
- Vibración minimizada de la herramienta durante el funcionamiento mediante el uso de boquilla 8°
- La tuerca de alta precisión hecha en Suiza mejora la estabilidad al presionar el collar uniformemente
- Diámetro del vástago aplicable: Ø1.8~Ø25

Portapinzas ER de diámetro reducido

# DSK

- Equilibrio G6.3 disponible para maquinado a max. 15,000 RPM
- Vibración minimizada de la herramienta durante el funcionamiento mediante el uso de boquilla 8°
- La tuerca de alta precisión de fabricación suiza mejora la estabilidad
- Diámetro del vástago aplicable: Ø1.8~Ø25

➤ Sistema de codificación

➤ Boquilla de primera clase (Hecha en Suiza )

Boquillas de fácil acoplaje

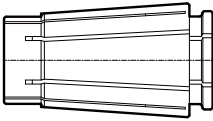

Herramientas endurecidas con tratamiento especial

➤ Aplicaciones multifuncionales

➤ Portapinzas

# Información técnica para portapinzas GERC

GER Boquilla\_GER

**GERC** *new*

- Pinza resistente a la corrosión a micro unidad
- Recubrimiento de alta tecnología para una precisión duradera
- Mayor vida útil de la herramienta y mayor productividad.

## Sistema de codificación

## Tecnología especial para recubrimiento

A diferencia de las pinzas GERC, las pinzas no recubiertas convencionales tienen las siguientes características:  
Las pinzas no recubiertas se ven afectadas por la corrosión debido a la alta humedad, el fluido de corte, el limpiador, la sal, el gas y muchos otros factores, lo que en consecuencia deteriora toda la calidad del mecanizado.

Cuando un collar se oxida, la vida útil de la herramienta se reduce y la precisión disminuye considerablemente. Para prevenir este problema, el tratamiento de la superficie por Se aplicó una micro unidad a las pinzas GERC para una protección eficaz y larga precisión duradera.

GERC

Competencia

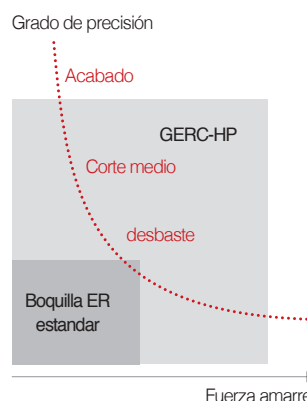

Dos muestras de pinzas después de 4 meses de uso. Izquierda: pinza GERC, derecha: sin recubrimiento

## GERC-HP

Un mandril de precisión del tipo pinza es caro que Estándar, pero aún tiene más ventajas en largo. Término costo y eficiencia. Usando GERC-HP puede Minimizar el reprocesamiento caro debido a una menor tolerancia con máxima precisión

Boquilla tipo precisión 2 $\mu$ m

## Precisión (L/D = 3)

Boquilla tipo estandar 5 $\mu$ m

Adaptador machos de alta velocidad

DST **new**

- Mandril roscado para maquinado de alta velocidad
- Estructura especialmente diseñada para absorber la carga de empuje y evitando daños en el grifo
- A través del sistema de refrigeración disponible.
- Rango aplicable: M1-M22

➤ Sistema de codificación

➤ Excelentes resultados, maquinado preciso

área de maquinado excelente

DST22  
(vc = 100 m/min)

Excelente corte

Adaptador convencional

Adaptador exclusivo para rosca

- Al roscar usar adaptador TER
- DST3: usar adaptador ER11

➤ Comparación de los perfiles de la rosca

Parte de entrada después de un uso      Extremo del macho después de un uso

DST

Adaptador portapinzas normal

Adaptador Synchro tap (DST7)

Buena figura de las estrías y en forma

Adaptador portapinzas general

El hilo está fuera de su forma. debido a un error de sincronización

Aumento de productividad de hasta el doble

# Serie Cabeza Angular

## Características

- Multi función/disponible para varios ángulos
- Cuerpo de aluminio, ligero

## Sistema de codificación

## Nombre de las partes de la cabeza angular

## Aplicaciones variadas

|                                  |                              |                              |                            |
|----------------------------------|------------------------------|------------------------------|----------------------------|
|                                  |                              |                              |                            |
| 0~90-ángulos rotación (MAH, KHU) | Fijado a 90-tipo grado (KAH) | Fijado a 45-tipo grado (KAC) | Tipo de amarre (HRAG, KAG) |

## Components

## Serie Cabeza Angular

### MAH

#### Tipo universal MAH (reforzado)

- Tipo reforzado Mejor rendimiento al mejorar la cabeza angular universal existente
  - Estabilidad en el mecanizado de moldes grandes
  - Utilice fresas integrales de 32 mm
  - Reforzado desde KHU Tipo

### HRAG

#### Tipo adjunto HRAG (reforzado)

- Tipo reforzado, incrementando la vida útil hasta un 200%
  - Estabilidad en careado
  - Estabilidad mejorada

### KHU

#### Tipo universal KHU

- Ajuste de ángulo libre hasta 90°
  - Los tipos HSK y SK son ordenados

BT50-KHU20-195

### KAG

#### Tipo adjunto KAG

- Ajuste de ángulo libre de 360° de lado a lado
  - Posible utilizar varias herramientas de BT40. y BT30
  - Los tipos HSK y SK son ordenados

BT40-SDC20-60  
(Ø12 E/M)

NT40-SDC20-60  
(Ø20 E/M)

BT40-NPM20-85  
(Ø20 E/M)

BT40-FMA25.4-45  
(Ø80 Fresa para escuadrado)

### KAH

#### Tipo modular KAH (90° Tipo)

- Cabezal angular fijo de 90°
  - En caso de usar una pinza, por favor contáctenos con anticipación
  - Los tipos HSK y SK son ordenados

BT50-KAH20-200

### KAC

#### Tipo modular KAC (45° Tipo)

- Cabezal angular fijo de 45°
  - Los tipos HSK y SK son ordenados

MHA para moldes (0°~90°)\_Tipo Reforzado

# BT-MAH

Barra Mandrinado

# FBH/B

- Perforación a alta velocidad y aburrída hacia atrás
- Equilibrio de alta precisión G2.5, cabeza G6.3
- Min. rango de ajuste: 2µm

➤ Sistema de codificación

➤ Velocidad trabajo

➤ Ajuste rango mandrinado

➤ Mandrinado hacia atrás

➤ Ajuste dirección de maquinado

Fácil cambio de dirección de maquinado.  
solo ajustando la mordida

# BT-FBH/B

Para mandrinado en desbaste

# TBC

- Amplia gama para mandrinado para diámetro grande - Ø130~Ø540 mm
- Estructura estable frente a la carga de corte - Ensamblaje mediante estructura de cola de milano
- Intercambiable con FBC - Con cabeza de mandrinar y raíl común, cartucho diferente
- Peso ligero (reducido en un 5%~20%)
- Diversos ángulos de aproximación del cartucho: 15°, 45°

## Serie FBC

### Para mandrinado de terminación

# FBC

- Amplia gama para mandrinado para diámetro grande - Ø130 ~ Ø540 mm
- Intercambiable con TBC
  - Con cabeza de mandrinar y raíl común, cartucho diferente [microcartucho + bloque de equilibrado]
- Varias placas dependiendo del bite
  - Placas aplicables: CCMT09T3/1204, TPMT1103 (Cermet, cBN, PCD)

### ➤ Sistema de codificación

BT50 - FMD50 - 85 + FBC 130S

Versátil sistema de herramientas de conforme a las especificaciones FMS

# Sistema Modular

- Sistema de herramientas versátil que cumple con la especificación FMS
- Combinación flexible de unidades de herramientas según condiciones del sujeto
- Unirse con un tornillo especialmente diseñado proporciona una alta precisión (error inferior a 5  $\mu\text{m}$ ) y una fácil separación para un solo paso
- Borde de corte del sistema de perforación alineado con la ranura de la llave de transmisión
- Precisión y rigidez correspondientes en comparación con el tipo de cuerpo único

## KORLOY Herramienta antivibración

# KORLOY DAMPING PRO

- Diseño especial que proporciona un excelente efecto antivibración y está optimizado para el trabajo en voladizos
- Capaz de aumentar el avance en comparación con el eje estándar con un mecanizado estable
- Mayor vida útil de la herramienta y menos ruido
- Proporciona una solución para moldes, mecanizado de cavidades profundas y trabajo de servicio pesado

### ➤ Sistema de codificación

|                           |   |  |   |   |   |                                  |

### ➤ Características

- Antivibración: Estructura antivibraciones de diseño exclusivo
- Material: Aleaciones de acero especiales
- Cuerpo antivibraciones: Con amortiguador de alta densidad
- Voladizo: Apto para 2D~5D
- Refrigeración: Dispone de refrigeración interna

BT Tipo

HSK Tipo

SK Tipo

Tamaño: Varios tipos y tamaños disponibles

### ➤ Comparación del tiempo de amortiguación de la vibración

## Evaluación del rendimiento

- **Condiciones de Corte:**  $f_z$  (mm/t) = 0.1  
 $vc$  (m/min) = 100
- **FRESA:** AMC4063HS 6 canales
- **Eje:** BT50-FMC22-210 Eje estándar  
KDP-BT50-FMC22-210 Damping pro

- **Condiciones de Corte:**  $f_z$  (mm/t) = 0.1  
 $vc$  (m/min) = 100
- **FRESA:** FMRC3063HRD-H 6 canales
- **Eje:** BT50-FMC22-210 Eje estándar  
KDP-BT50-FMC22-210 Damping pro

## Ejemplo de aplicación

| Mecanizado de moldes                        | Mecanizado con fresa de corte lateral         | Refrentado de alta profundidad                                      | Mecanizado por mandrinado de orificios profundos                      |
|---|---|---|---|
|   |   |   |   |
| Mejor productividad que con el eje estándar | Excelente rendimiento en el ranurado profundo | Mejor productividad y rugosidad superficial que con el eje estándar | Mejor rugosidad superficial y mecanizabilidad que con el eje estándar |

### Ejemplo de mecanizado con fresa de corte lateral

- Fallos en el tamaño y la rugosidad superficial debido a la vibración cuando se utiliza el eje estándar
- **Buen tamaño y rugosidad superficial usando DAMPING PRO**

- **Eje estándar**  
Condiciones de Corte:  
 $vc$  (m/min) = 50  
 $f_z$  (mm/t) = 0.1  
 $ae$  (mm) = 20
- **DAMPING PRO**  
Condiciones de Corte:  
 $vc$  (m/min) = 100  
 $f_z$  (mm/t) = 0.1  
 $ae$  (mm) = 20

### Ejemplo de mecanizado de cigüeñal de tamaño grande

- Eje estándar:  $ap = 2$  mm
- KORLOY DAMPING PRO:  $ap = 4$  mm disponible
- **2 veces mejor productividad**

- **Eje estándar**  
Condiciones de Corte:  
 $vc$  (m/min) = 100  
 $f_z$  (mm/t) = 0.15  
 $ap$  (mm) = 2
- **DAMPING PRO**  
Condiciones de Corte:  
 $vc$  (m/min) = 100  
 $f_z$  (mm/t) = 0.15  
 $ap$  (mm) = 4

- El tipo A se usa para la fresa de planeado JIS B4113
- Los tipos B y C son ejes para la fresa de planeado y escuadrado T-MAX
- El peso (kg) que se muestra en el gráfico no incluye el peso de la fresa de planeado
  - La llave y el tornillo van juntos
  - La llave de tuercas se vende por separado

## HT

(mm)

| Código | ØD | ØC | L   |
|--------|----|----|-----|
| HT-100 | 32 | 68 | 100 |

- Buena para establecer la longitud de herramientas al CNC
- No se interfiere entre setter altura táctil y la herramienta hace el trabajo seguro
- Precisión Localización: ± 0.003mm

## SC Limpiador de husillo

(mm)

| Código    | Cónico | N.W.   | G.W.   |
|-----------|--------|--------|--------|
| SC - BT30 | BT30   | 0.06kg | 0.08kg |
| BT40      | BT40   | 0.07kg | 0.1kg  |
| BT50      | BT50   | 0.16kg | 0.2kg  |
| HSK50     | HSK50  | 0.08kg | 0.12kg |
| HSK63     | HSK63  | 0.1kg  | 0.13kg |
| HSK100    | HSK100 | 0.5kg  | 0.7kg  |

### Características

- Las tiras de limpieza del limpiador cónico están hechas de piel de cordero
- Se usa para limpiar el interior del husillo para evitar la electricidad estática y ampliar la vida útil del husillo y el cono

## KCP

# J

## Ejemplos de Maquinados

### **Ej. de Maquinados Industriales**

- J02 Solución en Maquinado de Engranajes
- J04 Solución Industria Marítima
- J07 Solución Maquinado de Rodillos
- J08 Solución Industria Ferroviaria
- J10 Solución Tubería Industrial
- J12 Solución Maquinado de Rodamientos
- J13 Solución para el Desarrollo Industrial
- J14 Solución Industria Aeronáutica
- J18 Cuchillas

### **Ej. Maq. Industria Automotriz**

- J19 Cigüeñal
- J20 Sist. de Frenos
- J22 Bielas
- J24 Connecting Rod
- J26 Monoblock
- J28 Cabezas

## Maquinado de engranajes (Exterior)

### ➤ Cortador Para Desbaste

- Diametro Cortador: Ø300
- Numero de Insertos: 60
- Disponible para la alta velocidad de trabajo, los bordes en forma de V sirven para reducir la fuerza de corte

### ➤ Cortador Para Corte Medio

- Diametro Cortador: Ø280
- Numero de Insertos: 48
- Disponible para alta eficiencia, larga vida y alta productividad a través de la forma de inserto propia KORLOY
- Los Insertos deberan ir con el cortador del mismo lado, no pueden ser intercambiados

### ➤ Cortador para Acabado

- Diametro Cortador: Ø400
- Numero de Insertos: 20
- Los cortadores son realizados con un grado de precision 4.( KS, JS)
- Sistema de Chaflan esta disponible para un mejor maquinado.

### ➤ Hob

- Diametro Cortador: Ø350
- Numero de Insertos: 100
- Hob Indexable para desbaste
- Disponibles para personalizar la producción por el usuario

### ➤ King Drill

#### Diseño óptimo de broca indexable

- La forma de la broca y el rompeviruta han sido optimizados en la posición de los insertos central y periférico para un mejor control de viruta y acabado de superficie
- Grados, optimizados en la posición de los insertos central y periférico con el fin de maximizar la vida de la herramienta de corte
- Grado: PC3500, PC5300

### ➤ Rompeviruta VH

- Rompeviruta innovadora para corte medio
- Rendimiento mejorado en corte continuo
- Disponible en SNMM/CNMM

### ➤ TPDB

#### Broca indexable de alta precisión y alta eficiencia

- Broca altamente eficiente en alta velocidad y maquinado de alta avance
- Excelente rugosidad de la superficie

### ➤ Rompeviruta VT

- Excelente rigidez en maquinado de altoavance y profundidad
- Excelente resistencia al impacto y larga vida gracias a su estable estructura y rigidez
- Disponibles en: SNMM/CNMM

# Maquinado de Engranajes (interno)

## ↻ Cortador para Desbastes

- Diametro Cortador: Ø560
- Numero de Insertos: 140
- Disponible para todo el funcionamiento del engranaje del módulo, debido a los bordes diseñados en forma de escalera

## ↻ Cortador para Corte Medio

- Diametro Cortador: Ø400
- Numero de Insertos: 48
- Disponible para latoma de forma de la curva involuta de engranajes internos

## ↻ Cortador para Acabado

- Diametro Cortador: Ø400
- Numero de Insertos: 20
- Cortador para el acabado disponible para 4 gado de precisión de engranajes internos
- Insertoo para Chafan disponible para el cortador, eita evita hacer otra funcion

## ↻ King Drill

### Diseño óptimo de broca indexable

- La forma de la broca y el rompeviruta han sido optimizados en la posición de los insertos central y periférico para un mejor control de viruta y acabado de superficie
- Grados, optimizados en la posición de los insertos central y periférico con el fin de maximizar la vida de la herramienta de corte
- Grado: PC3500, PC5300

## ↻ TPDB

### Broca indexable de alta precisión y alta eficiencia

- Broca altamente eficiente en alta velocidad y maquinado de alta avance
- Excelente rugosidad de la superficie

## Industria Maritima

### ➤ Cortador para desbaste en bloque de cilindros

- Diametro Cortador:  $\varnothing 200$
- Insertos: SNCF1507ANN-MF
- Concepto de Economía: Insertos de 8 Filos, para herramienta de alto avance
- Exclusivo sistema de sujeción de KORLOY que proporciona un cambio rápido de inserción

### ➤ TPDB

#### Broca indexable de alta precisión y alta eficiencia

- Broca altamente eficiente en alta velocidad y maquinado de alta avance
- Excelente rugosidad de la superficie

### ➤ King Drill

#### Diseño óptimo de broca indexable

- La forma de la broca y el rompeviruta han sido optimizados en la posición de los insertos central y periférico para un mejor control de viruta y acabado de superficie
- Grados, optimizados en la posición de los insertos central y periférico con el fin de maximizar la vida de la herramienta de corte
- Grado: PC3500, PC5300

### ➤ Boreador de Bloque de Cilindros, Arbol de Levas(Cortador de Aluminio)

- Diametro Cortador:  $\varnothing 270$
- Insertos: LNE434/SDKX1506
- Cortador de aluminio de rotación derecha, Fácil de manejar, boreador de alta precisión.

**↻ Cortador para cilindros del motor (Ambos)**

- Diametro Cortador: Ø200
- Inserto: LNE434/LNCS1907-R3.0-WC
- Diseñados para aplicaciones de desbaste y corte medio
- Para alta eficiencia en el maquinado utilice el Insertoo LNE 434 grado para desbaste y alta rentabilidad
- Una buena superficie en el maquinado utilice el LNCS1907-R3.0-WC Insertoo Wiper para corte medio

**↻ Cortador para desbaste en Cilindros del Motor**

- Diametro Cortador: Ø250
- Inserto: SECN2606AFN
- Cortador de alta incidencia, especial para aplicaciones de maquinado que tienen tendencia a hacer rechinidos (las evita)

**↻ Cortador Ajustable paramaquinado medio**

- Diametro Cortador: Ø250
- Inserto: LNCS1907-C1.5-WC
- Dispositivo de corte regulable en altura brinda un excelente superfi cie de acabado

**↻ Cortador para cilindros del motor**

- Diametro Cortador: Ø250
- Inserto: RDKT2006M0
- Varios tamaños de Insertoos estan disponibles para el requerimiento de la pieza que este maquinando
- Inserto rígidos para un excelente maquinado

**Ind. Maritima (Cigüeñal/Propelas)**

➤ **Exclusivo sistema interno de KORLOY Pin miller**

- Diametro Cortador: Over Ø2000
- Peso: 1.5 tons
- Pin molinero para eje del cigüeñal del motor de barco con el tamaño mediano
- Fase especial con sistema de montaje desarrollado por KORLOY hace que sea fácil de manejar y proporciona excelente rendimiento de corte con la formación de viruta

➤ **La cara superior de la herramienta de mecanizado**

- Diametro Cortador: Ø150
- Inserto: CDEW170708R
- Insertos con angulo de alivio positivos son aplicados para obtener un corte uniforme sin fluctuaciones

➤ **La cara superior de la hélice herramienta de mecanizado**

- Diametro Cortador: Ø250
- Inserto: SECN1904EER
- El inserto de doble capa proporciona gran profundidad de corte

## Maquinado de Rodillos (cuerpo/forma/tronzado)

### ➤ Maquinado de Rodillos (cuerpo/forma/tronzado)

Competencia

NC6315

- Rompevirutas mas cercas del borde de corte proporciona un mejor control de la viruta, incluso en ranurado profundo
- El alto grado de dureza del recubrimiento tiene excelente resistencia al desgaste y previene grandes daños por la carga de corte (la foto muestra los daños despues del borde, mismo Tiempo de maquinado en mismas condiciones)

### ➤ Ej. de Aplicacion

Competencia

NC6315

- Equipado con un interruptor de viruta ancho suficiente para evitar el desgaste del cráter
- Mejor control de viruta desde el inicio del mecanizado, junto con el grado de recubrimiento de alta dureza proporciona una vida útil de la herramienta 3 veces mayor que Herramienta convencional (especialmente en el acabado).

La combinación del grado de recubrimiento de alta dureza (NC6315) y el rompevirutas muestra un mejor rendimiento.

Rompevirutas mas cercas del borde de corte proporciona un mejor control de la viruta, incluso en ranurado profundo

### ➤ Tronzado de Rodillos

- inserto de diseño especial que provee un mejor control de viruta en ranurado profundo
- El alto grado del recubrimiento proporciona una excelente resistencia al desgaste.

Para tronzado

Para desbaste y corte medio en Torneado exterior

Para formar y maquinado de juntas

### ➤ Torneado externo de rodillos

- La combinación de alta dureza del recubrimiento NC6110 con rompeviruta proporciona mayor vida útil con el control suave para virutas
- varios diseños de filos de corte son aplicables de acuerdo a material de pieza de trabajo y condición de corte

### ➤ Formado y ranurado de Rodillos

- Rompeviruta especial adecuada para el formado (ingeniería de rompevirutas ancho y profundidad)
- Filo de corte especialmente tratado que previene fracturas.

**Industria ferroviaria (Raíl)**

➤ **Fresa para perfil del raíl**

- Diametro Cortador: Ø160
- Numero de Insertos: 54
- Diseños especiales se pueden realizar acorde a las necesidades y especificaciones del cliente

➤ **Fresa para parte superior de raíl**

- Diametro Cortador: Ø160
- Numero de Insertos: 16
- Formado preciso del raíl es posible

- Diametro Cortador: Ø300
- Numero de Insertos: 33
- Un diseño de cuerpo y árbol de fresado proporciona una alta rigidez

➤ **Fresa para el rebajado superior del raíl**

- Diametro Cortador: Ø200
- Numero de Insertos: 24
- Inserto economico de 8 filos
- Diseños especiales se pueden realizar acorde a las necesidades y especificaciones del cliente

➤ **Fresa para el perfil superior de los raíles**

- Diametro Cortador: Ø240
- Numero de Insertos: 25

➤ **Fresa para reparación de raíles**

- Diametro Cortador: Ø600
- Numero de Insertos: 198
- Cortador que realiza reparaciones en partes en partes específicas del raíl

# Industria Ferroviaria (Rueda)

## ➤ Inserto LNUX para trabajo en ruedas (Reperación)

- Material: SSW2. Ø920~1000
- Condiciones de Corte:  $vc = 78\text{m/min}$  ( $13\sim 18\text{min}^{-1}$ )  $fn = 1.0\text{mm/rev}$   $ap = 3\sim 4\text{mm}$
- Inserto: LNUX301940-TM Grado: NC3215
- Resultado: Excelente evacuación de virutas, estructura estable y larga vida de la herramienta

**LNUX301940-TF**

- Para corte ligero, genera una carga de corte bajo

**LNUX301940-TM**

- Diseño integral para uso en general, filo de corte fuerte con buen flujo de viruta y formación (Primera recomendación)

| Rocedimiento de Traba | A  | B  | C |
|-----------------------|--|--|---|
| Inserto               | LNUX301940-TF/TM                                   | LNUX191940-25/22   |   |
| Grado                 | NC3215   | NC3215   |   |
| Condicion de Corte    | Redusca la velocidad en la parte mas profunda de A | Incremente la velocidad para tener una buena evacuación de virutas |   |

## ➤ RCMX Inserto para rueda de ferrocarrilJ

- Material: SSW2. Ø840
- Condiciones de Corte:  $vc = 55\sim 100(\text{sfm})$ ,  $fn = 1.0\sim 1.5\text{mm/rev}$ ,  $ap = 1\sim 6\text{mm}$
- Inserto: RCMX3209MO-SL Grado: NC3215
- Resultado: Excelente evacuación de virutas, estructura estable y larga vida de la herramienta

**Rompeviruta VT**

- Resistente lo de corte para maquinados de alto avance y profundidades de corte
- El diseño de la rompeviruta provee una excelente resistencia al impacto
- Tipo SNMM

**Rompeviruta SL**

- rompevirutas que cubren una amplia gama de aplicaciones
- Un mejor control de viruta extiendela vida util de la herramienta

**Rompeviruta B**

- Diseño integral para desbaste que brinda una excelente fuerza en el borde con vida larga de la herramienta

**Rompeviruta SB**

- Mejor control de viruta con baja carga de corte en el maquinado

**Rompeviruta TM**

- Rompeviruta para corte Medio a Acabado, acabado de la superficie adrcuada, superior resistencia al desgaste

| Rocedimiento de Traba | A  | B   | C   |
|-----------------------|--|---|---|
| Insertos Disponibles  |  |  |  |
| Portainsero           | PSDNN5050-U25  | PRDCN5050-U32<br>PRGCN5050-U32  | PSSNR5050-S25   |
| Inserto               | SNMM250724-GH  | RCMX3209MO-SL   | SNMM250724-VT   |
| Grado                 | NC3215   | NC3215  | NC3215  |

**Tuberías (Fresado de borde)**

➤ **Maquinado de Forma "X"**

- Maquinado de forma "X" en el lado extremo de la placa de acero, para hacer la soldadura de bisel
- Localizador de tipo cuña apriete sistema aplicado para el cortador proporciona durabilidad del corte, así como un fuerte poder de fijación
- Grado: NC5340

➤ **Maquinado de Forma "I"**

- Un maquinado en forma "I" en ambos lados del extremo de la placa de acero, para hacer bisel o soldadura plano de fondo
- Variedad de Insertos (con rompevirutas o sin rompevirutas) están disponibles de acuerdo a sus condiciones de corte
- Grado: NC5340

➤ **Maquinado de Forma "Y"**

- Un maquinado en forma "Y" tanto en el lado extremo de la placa de acero, para hacer la soldadura de bisel
- Amplio bolsillo chip de corte proporciona durabilidad de la misma por reducir el contacto de la viruta con el cuerpo de la fresa

➤ **Maquinado Especial**

- El diseño de cortadores especiales para el corte lateral en placas de acero, esta disponible segun las especificaciones y requerimientos del cliente

**Tuberia (Eliminación de imperfección/Tronzado/Biselado)**

| Metodo de Trabajo | Rangode Aplicación                                      | Insertos Disponibles  | Cortador |
|-------------------|---|---|----------|
|                   | Para Eliminación de imperfecciones en la parte exterior | SDMX80-R□□/SEGW54-R□□<br>SNMG150708-R□□/SNMN1207(SNU452)-□□R<br>SNMN1507(SNU552)-□□R/SOET1906-254<br>SEGX2509-R□□ | Especial |
|                   | Para Eliminación de imperfecciones en la parte interior | AR□□(AC)/SF□□R-□□   |          |

**Cortador de chaflán**

- Herramienta para maquinado de chaflán en la cara de la tubería
- El diseño del angulo del chaflán es personalizado segun los requerimirtos del cliente
- Costo efectivo: Insertos cuadrados y triangulares de doble lado, que provee 8~6 filos respectivos efectivos de corte
- Grado: NCM325, PC3500

Rodamientos

➤ Para careado y trabajo exterior

Para Careado

Inserto: SRGP R/L

For external working  
Inserto: SRGP R/L E

- Para aplicaciones de trabajo interno, externo y careado

➤ Para Interior y R-chaflan externo

Para chaflan externo

Tipo F CMSN R/L

Para chaflan interno  
Tipo B CMSN R/L

- Inserto de 8 filos
- Inserto de forma R realiza corte en la esquina tanto interno como externo

➤ Parta Trabajo Interno

Tipo B SRCP R/L

- Aplicable sobre Ø12

Tipo B SSKP R/L

- Aplicable sobre Ø11.5 con inserto de 4 filos para trabajo lento e interno

➤ Para Vias de Rodamiento

- Para vías de rodamiento internas y externas
- Inserto con 3 filos de corte
- Es capaz de personalizarse

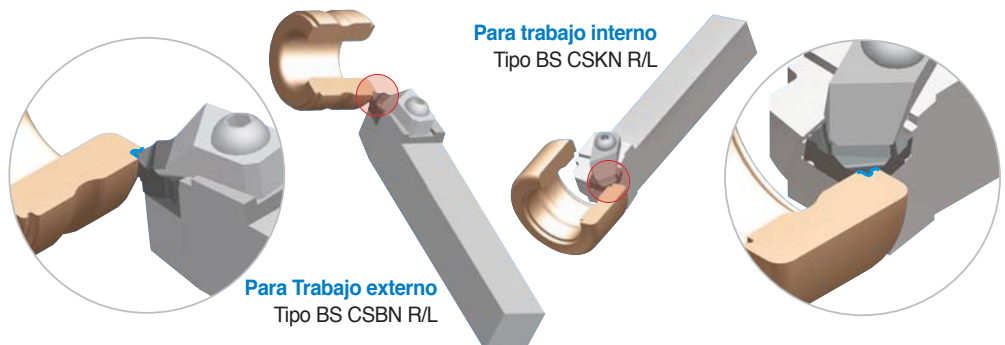

Para trabajo externo  
Tipo RW CKFN R/L

Para trabajo interno  
Tipo RW CKGN R/L

➤ Para Cubiertas

- Para proteger de trabajo en el rodamiento interno y externo
- Inserto con 3 filos de corte
- Es capaz de personalizarse

Para Trabajo externo  
Tipo BS CSBN R/L

Para trabajo interno  
Tipo BS CSKN R/L

## Generación de energía (Eje de generación de energía eolica)

### ➤ Rompeviruta VH

- Buen control de viruta en maquinado pesado
- Excelente rendimiento para el maquinado de bordes
- Recomendado para corte continuo
- Tipo SNMM/CNMM

### ➤ Rompeviruta VT

- Rompevirutas Resistentes lo de corte para aplicaciones de alto avance y profundidad de corte
- El rompevirutas proporciona excelente resistencia al impacto
- Tipo SNMM/CNMM

### ➤ TM (Roscado milimetrico)

- Herramienta de roscado milimetrico
- Varios tipos de holder e insertos (standard, largo, conico)
- Diametro del tornillo: Ø9~Ø46mm

### ➤ H Endmill

#### Endmill para mecanizado de acero de alto endurecimiento. a altas velocidades

- Nuevo grado (PC303S, PC310U), ultra fino Sustrato y garantía de recubrimiento AlTiSiN. excelente resistencia al desgaste
- Tratamiento de filo especial, filo especial. El diseño fue aplicado por menos astillado y más largo. herramienta de vida

### ➤ RCMX

- Alta calidad en maquinado
- Inserto rígido que provee una excelente superficie en el acabado, prolongando así la vida de la herramienta
- Tipo RCMX

### ➤ Vulcan Drills (VZD)

- Cuerpo rígido para alto avance y mecanizado de precisión.
- Mejor evacuación de viruta de rompevirutas mejorado
- Aplicable para el taladrado bajo mal corte. condiciones

### ➤ King Drill

#### Diseño óptimo de broca indexable

- La forma de la broca y el rompeviruta han sido optimizados en la posición de los insertos central y periférico para un mejor control de viruta y acabado de superficie
- Grados, optimizados en la posición de los insertos central y periférico con el fin de maximizar la vida de la herramienta de corte
- Grado: PC3500, PC5300

## Industria Aeronautica (Motor/Turbina)

### TPDB

#### Rendimiento mejorado en la broca indexable

- Alto rendimiento de la broca a alta velocidad y con alto avance
- Broca indexable avanzada la cual ofrece orificios precisos con excelente acabado

### Torneado ISO

- Disponible para personalizar los elementos de su conjunto y especial para la forma complicada y varios

### Bar de Interior

#### Torneado interno

- Barra interior ISO para el mecanizado interior

**Rich Mill**

- Incrementa el número de filos y excelente vida de la herramienta debido a los 8 filos del inserto
- Suave corte con baja carga de corte debido a la geometría única y al alto ángulo de incidencia del inserto, esta combinación proporciona un excelente vida de la herramienta

**MSD**

**Larga vida de la herramienta debido a su recubrimiento**

- Buen control de viruta
- Disminución de astillamiento y aumento de la capacidad de corte, debido a la forma aerodinámica
- Resistencia al impacto incrementada debido al recubrimiento sub-micron de PVD K Black

**Laser Mill**

**Endmill indexable multifuncional**

- Grados extremadamente duros que proveen una larga vida a la herramienta
- Fácil y simple sistema de sujeción usando solo un tornillo
- Excelente calidad para acabado fino debido a su precisión

**H Endmill**

**Endmill para mecanizado de acero de alto endurecimiento a altas velocidades**

- Nuevo grado (PC303S, PC310U): sustrato ultra fino y El revestimiento AlTiSiN garantiza una excelente resistencia al desgaste.
- Tratamiento de filo especial: diseño de filo de corte especial. Aplicado por menos astillado y mayor vida útil de la herramienta.

**Industria Aeronautica (tren de aterrizaje/Accesorios)**

**HRMDouble**

**Alta eficiencia y costo efectivo utilizando el inserto de doble filo**

- Ahorro efectivo en costo-inserto al utilizar insertos con 6 filos de corte
- Corte liso utilizando un alto angulo de incidencia en el filo del inserto

**MGT**

**Para Ranurado, Torneado, Perfilado, Tronzado**

- Herramienta de ranurado multifuncional debido a la variedad de maquinados que realiza

**Pro-X Mill**

**Herramienta Fresado para alta velocidad en Aluminio**

- El sistema único de montaje del inserto proporciona una sujeción firme del inserto
- La superficie del espejo y el alto ángulo de inclinación del inserto proporcionan una superficie mecanizada excelente al reducir la carga de corte y filo de adicción
- Grado: H01

**SSEA**

**Endmill de carburo sólido para el maquinado de aluminio**

- Endmill de geometría y diseño avanzada que evita la adherencia de material al filo de corte
- Superficie de maquinado superior
- Endmill con recubrimiento DLC esta disponible

Titanio  
Imagen proveida por: KPC Inc

### King Drill

#### Diseño óptimo de broca indexable

- La forma de la broca y el rompeviruta han sido optimizados en la posición de los insertos central y periférico para un mejor control de viruta y acabado de superficie
- Grados, optimizados en la posición de los insertos central y periférico con el fin de maximizar la vida de la herramienta de corte
- Grado: PC3500, PC5300

### MLD (Mach Long Drill)

- Perforación directa sin operación separada(perforación de paso) sobre 20 x D
- Mayor espacio a lo largo de la flauta en la broca ofrece un control e caz de viruta
- El diseño especial para el cuerpo rígido proporciona perforación lisa sin flexión de perforación

### Alpha Mill

#### Herramienta de fresado multifuncional

- Amplia cobertura de la operación de fresado debido a su variedad de cortadores e insertos
- El diseño de rompevirutas tridimensional proporciona corte suave

### Fresas enterizas cementadas

- Ángulo espiral positivo (más de 40 grados) capaz de obtener un buen corte
- Fresado de alta velocidad disponible debido a que reduce la temperatura de trabajo
- Se espera una larga vida útil de la herramienta aplicando material de carburo endurecido
- Herramienta soldada económica debido al reabastecimiento de 2 o 3 veces disponible

## Cuchillas

### Aplicación

- Para cinta de video/Para cinta de audio
- Para cinta magnetica/Para placa de laton, Baterias moviles

### Selección de Grados

- Cuchilla superior: Espesor:  $\pm 0.01 \sim 0.02 \text{mm}$
- Cuchilla inferior: Espesor:  $\pm 0.001 \text{mm}$  / Plano: menor  $0.0005 \text{mm}$   
Superficie pulida, rugosidad: menor  $0.05 \text{S}$

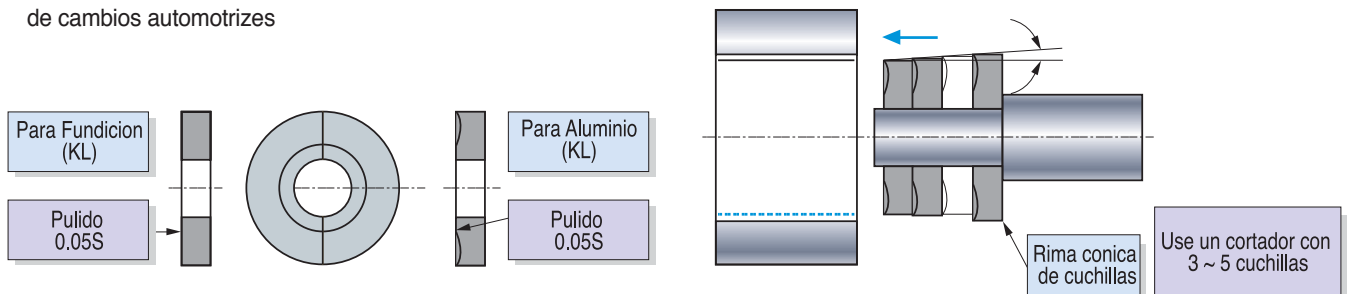

### Ej. de Maquinado

## Rima de Cuchillas (Rectificadoras)

### Aplicación

- Los cortadores brochas (Rectificadoras) se utilizan para el maquinado interior de cojinetes en cajas de cambios automotrices

### Orden

- Codigo para hierro forjado: KL  $\text{Ød} \times \text{ØD} \times \text{T}$
- Codigo para Aluminio: AL  $\text{Ød} \times \text{ØD} \times \text{T}$   
: AL  $\text{Ød} \times \text{ØD} \times \text{T} \times \alpha^\circ$   
(Si no se menciona ningun angulo,  $\alpha = 30^\circ$ )

**Ejemplo de herramienta de motor de automóvil (Cigüeñal Shaft)**

**Perforación de petróleo**

Estructura de Taper Spline  
(Rigidez mejorada por el área de contacto aumentado)

**Linea de Lubricacion - Mach Long Drill (MLD)**

- Mecanizado sin operación de avance de paso para el taladro de agujero profundo como 20D
- El rendimiento óptimo con el sistema MQL

**Cortador del Cigüeñal (Interno y Externo)**

**Extremo posterior - Alpha Mill**

**Brida final - Alpha Mill**

Ej de Maquinado (Portamasas Sist. de Frenos)

Barras para Interior

Mach Drill

Cortador lateral

Cortador lateral

Ej. Maquinado Automotriz (Bielas)

Barrenado

Rich Mill (RM4)

Cortador Lateral

Cortador Lateral

Rich Mill (RM4)

Rich Mill (RM8)

Barrenado (King Drill)

Broca Paso

Barrenado

**Ej. Maquinado Automotriz (Monoblock)**

**Cara Superior (Desbaste)**

• Insertos con 8 filos de corte

**Cara Superior (Acabado) - Fresas de gran avance**

**Sellos - Alpha Mill**

**Rima**

**Asiento de tapa de rodamiento - Forma de cortador**

**Asiento de tapa de rodamiento - Forma de cortador**

**Perforación de cilindro(Desbaste)**  
- Cortador de barrenar

**Fresado trasero y delantero**  
- cube couple mill

- Cortador de alto avance hecho de Aluminio
- Debido al peso ligero es Fácil de dirigir y evitar accidentes

**Corte base de cojinetes -**  
**Cortador de Cuadrilla**

**Corte base de cojinetes -**  
**Cortador de Cuadrilla**

Ej. Maquinado (Cabeza)

**Cara Superior (Desbaste y Acabado)**  
- Fresas de gran avance

• Insertos de Carburo, Insertos PCV

**Cara Superior (Desbaste y Acabado)**  
- Aero Mill

• Debido al peso ligero del cortador 50% menor en comparación con el de acero, tiene un funcionamiento excelente de corte a altas velocidades de maquinado

**Rima de Paso**

**Rima Recta**

**Cara Inferior (Desbaste y Acabado)**  
- Fresas de gran avance

• Insertos de Carburo, Insertos PCV

**Boreador Asiento de Valvulas**

**Asiento de válvula - Apolo cutter**

**Cara Superior (Barrenado) - Mach Drill**

**Asiento de Cojinetes arbol de levas - Boring Lineal**

**Camara de Arbol de levas - Rima de Alta Velocidad**

- Trabaja velocidades estables sin vibraciones

- Disponible para mecanizado de alta velocidad
- Excelente acabado superficial rugosidad

## Información General I

- L02 Grados y Piezas de Trabajo
- L06 Simbología: Acero, Metales No-Ferrosos
- L07 Tabla de Conversión materiales
- L08 Tabla para Calculo de Dureza
- L09 Propiedades grados de KORLOY

## Información Técnica

- L10 Información Técnica Torneado
- L20 Información Técnica Fresado
- L24 Información Técnica Tapers
- L27 Información Técnica Endmills
- L30 Información Técnica Brocas

## Información General II

- L36 Comparación de Rompevirutas
- L37 Tabla de Grados KORLOY
- L40 Comparación de Grados Torneado
- L41 Comparación de Grados Fresado

## Acero Carbon, Aleacion de Acero para uso en estructuras

| Ni                             | 8.9                                   | -           | 20  | 0.22                                | 13.3  | 1,455                |

## Forma del inserto y terminología

## Relación de ángulos entre la herramienta y la pieza de trabajo

| Inclinación Efectos del filo | Terminología   | Función   | Efectos  |
|------------------------------|--|---|--|
| <b>Ángulo de Inclinación</b> | Ángulo de Incidencia Lateral<br>Ángulo de Incidencia | • Fuerza de corte, calor de corte, los efectos del control de la viruta el vidade la herramienta                                      | • (+): Máquina-capacidad excelente (reduciendo la fuerza de corte, la fuerza de debilitamiento del filo)<br>• (+): Cuando capacidad de maquinado excelente la capacidad que trabaja la máquina<br>• (-): Cuando es fuerte el filo es necesario que la condición o la escala sea interrumpida |
| <b>Ángulo de incidencia</b>  | Ángulo de relieve y relieve lateral                  | • Solamente contacto del filo con la cara de corte  | • (-): El filo es fuerte pero tiene vida corta de la herramienta por hacer mal funcionamiento del filo   |
| <b>Ángulo del Filo</b>       | Ángulo de filo                                       | • Control de la viruta y dirección de fuerza del corte  | • (+): Control mejorado de la viruta porque el grueso de la viruta es grande   |
|                              | Ángulo de filo lateral                               | • Residuos saltan sin control, la dirección de la fuerza de corte afecta a control de la virutay a la dirección de la fuerza de corte | • (+): El filo fuerte debido a la fuerza de corte distribuida pero al control de la viruta es malo por grueso fino de la viruta<br>• (-): Funcionamiento mejorado de la viruta   |
|                              | Ángulo de filo de final                              | • Previene la fricción entre el filo y la cara de corte   | • (-): El filo es fuerte pero tiene vida corta de la herramienta por hacer mal funcionamiento del filo   |

## Formulas para maquinado

### Velocidad de Corte

$$vc = \frac{\pi \times D \times n}{1000} \text{ (m/min)}$$

- vc: Velocidad del corte (m/min)
- D: Diámetro (mm)
- n: RPM (min<sup>-1</sup>)
- π: Constante Circular (3.14)

### Avance

$$fn = \frac{vf}{n} \text{ (mm/rev)}$$

- fn: Avance por diente (mm/rev)
- vf: Alimentación de la tabla (mm/min)
- n: RPM (min<sup>-1</sup>)

### Superficie

- Rmax: rugosidad en perfil (rugosidad de superficie máxima) (μ)
- fn: Alimentación por la revolución (mm/rev)
- r : Radio de punta

### Azperiza Superficial Teorica

$$R_{max} = \frac{fn^2}{8r} 1000 (\mu\text{m})$$

### Azperiza superficial

Acero:  $R_{max} \times (1.5 \sim 3)$   
Fundición:  $R_{max} \times (3 \sim 5)$

### Poder Requerido

$$P_{kw} = \frac{Q \times kc}{60 \times 102 \times \eta}$$

$$P_{HP} = \frac{P_{kw}}{0.75}$$

$$Q = \frac{vc \times fn \times ap}{1000}$$

- P<sub>kw</sub>: Poder requerido (kW)
- P<sub>HP</sub>: Poder requerido (HP)
- vc: Velocidad del corte (m/min)
- ap: Profundidad de corte (mm)
- fn: avance por revolución (mm/rev)
- kc: Resistencia de corte específica (kg/mm<sup>2</sup>)
- η: Eficiencia de maquinado (0.7~0.8)

### Rango de Material Removido

#### Kc aproximados

|                        |     |
|------------------------|-----|
| Acero Suave            | 190 |
| Acero medio en Carbón  | 210 |
| Acero Alto en Carbón   | 240 |
| Aleacion baja en Acero | 190 |
| Aleacion alta en acero | 245 |
| Fundición              | 93  |
| Fundición Maleable     | 120 |
| Bronze, Latón          | 70  |

$$Q \text{ (cm}^3\text{/min)} = vc \times ap \times fn$$

- Q: Rango material removido (cm<sup>3</sup>/min)
- ap: Vel. Corte (mm)
- vc: Velocidad del corte (m/min)
- fn: Alimentación por la revolución (mm/rev)

## ● Tiempo de Maquinado

### Maquinado Externo 1

#### RPM Constante

$$T = \frac{60 \times L}{f_n \times n}$$

#### Vel. de corte constante

$$T = \frac{60 \times \pi \times L \times D}{1000 \times f_n \times v_c}$$

T : Tiempo que trabaja a máquina (sec)  
 L : Longitud de corte (mm)  
 f<sub>n</sub> : Alimentación por la revolución (mm/rev)  
 n : Revolución por minuto (min)  
 D : Diámetro del objeto (mm)  
 v<sub>c</sub> : Velocidad del corte (m/min)

### Maquinado Externo 2

#### RPM Constante

$$T = \frac{60 \times L}{f_n \times n} \times N$$

#### Vel. de corte constante

$$T = \frac{60 \times \pi \times L \times (D_1 + D_2)}{2 \times 1000 \times f_n \times v_c} \times N$$

T : Tiempo que trabaja a máquina (sec)  
 L : Longitud de corte (mm)  
 f<sub>n</sub> : Alimentación por la revolución (mm/rev)  
 n : Revolución por el minuto (min)  
 D<sub>1</sub> : Diámetro máximo del objeto (mm)  
 D<sub>2</sub> : Diámetro mínimo del objeto (mm)  
 v<sub>c</sub> : Velocidad del corte (m/min)  
 N : El número de paso = (D<sub>1</sub>-D<sub>2</sub>)/d/2

### Careado

#### RPM Constante

$$T = \frac{60 \times (D_1 - D_2)}{2 \times f_n \times n} \times N$$

#### Vel. de corte constante

$$T_1 = \frac{60 \times \pi \times (D_1 + D_2) \times (D_1 - D_2)}{4000 \times f_n \times v_c} \times N$$

T : Tiempo que trabaja a máquina (sec)  
 T<sub>1</sub> : Tiempo que trabaja a máquina antes del máximo RPM (sec)  
 L : Anchura de trabajar a máquina (mm)  
 f<sub>n</sub> : Alimentación por la revolución (mm/rev)  
 n : Revolución por el minuto (min)  
 D<sub>1</sub> : Diámetro máximo del objeto (mm)  
 D<sub>2</sub> : Diámetro mínimo del objeto (mm)  
 v<sub>c</sub> : Velocidad del corte (m/min)  
 N : El número de paso = (D<sub>1</sub>-D<sub>2</sub>)/d/2

### Ranurado

#### RPM Constante

$$T = \frac{60 \times (D_1 - D_2)}{2 \times f_n \times n}$$

#### Vel. de corte constante

$$T_1 = \frac{60 \times \pi \times (D_1 + D_2) \times (D_1 - D_2)}{4000 \times f_n \times v_c}$$

T : Tiempo que trabaja a máquina (sec)  
 T<sub>1</sub> : Tiempo que trabaja a máquina antes del máximo RPM (sec)  
 L : Anchura de trabajar a máquina (mm)  
 f<sub>n</sub> : Alimentación por la revolución (mm/rev)  
 n : Revolución por el minuto (min)  
 D<sub>1</sub> : Diámetro máximo del objeto (mm)  
 D<sub>2</sub> : Diámetro mínimo del objeto (mm)  
 v<sub>c</sub> : Velocidad del corte (m/min)

### Tronzado

#### RPM Constante

$$T = \frac{60 \times D_1}{2 \times f_n \times n}$$

#### Vel. de corte constante

$$T_1 = \frac{60 \times \pi \times (D_1 + D_3) \times (D_1 - D_3)}{4000 \times f_n \times v_c}$$

$$T_3 = T_1 + \frac{60 \times D_3}{2 \times f_n \times n_{max}}$$

T : Tiempo que trabaja a máquina (sec)  
 T<sub>1</sub> : Tiempo que trabaja a máquina antes del máximo RPM (sec)  
 T<sub>3</sub> : Tiempo que trabaja hasta máximo RPM (seg)  
 f<sub>n</sub> : Alimentación por la revolución (mm/rev)  
 n : Revolución por el minuto (min)  
 n<sub>max</sub> : Revolución por el minuto máxima (min)  
 D<sub>1</sub> : Diámetro máximo del objeto (mm)  
 D<sub>3</sub> : Diámetro máximo en el máximo RPM (mm)  
 v<sub>c</sub> : Velocidad del corte (m/min)

## ➤ Condición de Corte

- El trabajar con máquina deseables significa tiempo breve que trabaja la máquina, larga vida de la herramienta y buena precisión. Ésta es la razón que la condición apropiada del corte para cada las herramientas se debe seleccionar según las características de material, dureza, formas, para la eficacia de la máquina

## ➤ Velocidad de Corte

- **Pieza de trabajo:** S45C (180HB)
- **Criterio de la vida de la herramienta:** VB = 0.2 mm
- **Profundidad del corte:** 1.5 mm
- **Alimentación:** 0.3 mm/rev
- **Portainserto:** PCLNR2525-M12
- **Inserto:** CNMG120408, Corte seco

(La característica de la vida de la herramienta del grado de P)

- **Pieza de trabajo:** STS304 (200HB)
- **Criterio de la vida de la herramienta:** VB = 0.2 mm
- **Profundidad del corte:** 1.5 mm
- **Alimentación:** 0.3 mm/rev
- **Portainserto:** PCLNR2525-M12
- **Inserto:** CNMG120408, Corte seco

(La característica de la vida de la herramienta del grado de M)

- **Pieza de trabajo:** GC300 (180HB)
- **Criterio de la vida de la herramienta:** VB = 0.2 mm
- **Profundidad del corte:** 1.5 mm
- **Alimentación:** 0.3 mm/rev
- **Portainserto:** PCLNR2525-M12
- **Inserto:** CNMG120408, Corte seco

(La característica de la vida de la herramienta del grado de K)

## ➤ Condición de Corte Efectiva

- Cuando la velocidad del corte aumenta el hasta 20% en un uso, la vida de la herramienta disminuye respectivamente abajo del 50%. Aunque inverso, si la velocidad del corte aumenta el hasta 50% las disminuciones de la vida de la herramienta abajo hasta el 20%. Por una parte si cortar velocidad es vida demasiado baja de la herramienta (20-40 m/min) acorta debido a la vibración

## ➤ Avance

- El nivel de entrada en torneado significa el intervalo progresado de una distancia en un pedazo del trabajo dentro de 1 revolución. El nivel de entrada significa la alimentación de la tabla dividida por el número de dientes del cortador (nivel de entrada por el diente)

## ➤ Efectos del Avance

- Cuando el nivel de entrada disminuye el desgaste del flanco es aumentos. Cuando el nivel de entrada es demasiado bajo, la vida de la herramienta se acorta radicalmente
- Cuando el nivel de entrada aumenta, el desgaste del flanco consigue un más grande debido a las temperaturas altas, no obstante los niveles de entrada efectúan vida de la herramienta menos que la velocidad del corte. Y niveles de entrada más altos mejoran eficacia que trabaja a máquina

(Correlación entre el avance y el desgaste en el flanco en torneado de acero)

- **Pieza de trabajo:** SNCN431
- **Grado:** ST20
- **Vel de corte:** 200 m/min
- **Profundidad:** 1.0 mm
- **Tiempo de corte:** 10 mm

## ➤ Profundidad de Corte

- Determinado por los permisos requeridos a trabajar por la máquina un material y la capacidad la máquina puede tolerar. Hay límites del corte según las diversas formas y tamaños del inserto

(La relación entre la profundidad del corte y el flanco de torneado de a)

- **Pieza de trabajo:** SNCN431
- **Grado:** ST20
- **Vel de corte:** 200 m/min
- **Avance:** 0.2 mm/rev
- **Tempo de corte:** 10 mm

## ➤ Efectos de la Profundidad de Corte

- La profundidad del corte no tiene una influencia grande el vida de la herramienta
- Cuando la profundidad del corte es pequeña el pedazo del trabajo no se corta sino se frota algo. En estos casos, la máquina del trabajo endureció las piezas que disminuyen vida de la herramienta
- Al trabajar la máquina con una profundidad de corte más pequeña de la escala, generalmente causa desgaste anormal debido a impurezas duras en la superficie de trabajo

(Partes superficiales incluyendo el desbaste de la escala de fresado)

## 🔄 Ángulo de Relieve

- El ángulo de relieve evita la fricción entre el objeto y la cara del inserto y hace que el filo se mueva a lo largo del objeto fácilmente

### ● Relación entre el ángulo de relieve y el flanco de uso

#### Afecta

1. Si el ángulo de relieve es grande el desgaste del filo disminuye
2. Si el ángulo de relieve es grande la fuerza del filo se debilita
3. Si el ángulo de relieve es pequeño habrá rechinido

#### Selección de sistema

1. Pieza de trabajo endecida, cuando el filo es fuerte es necesario un ángulo de relieve baja
2. Pieza de torneado suave, Utilizar Ángulo de alto relieve

- **Pieza de trabajo:** SNCM431 (HB)
- **Grado:** P20
- **ap:** 1 mm
- **fn:** 0.32 mm/rev
- **T:** 20 mm

## 🔄 Ángulo de Corte Lateral

- El ángulo de filo lateral tiene influencia grande en flujo de la viruta y el ángulo de filo lateral apropiado de la fuerza de corte por lo tanto es muy importante

### ● Ángulo de filo lateral y grueso de la viruta

- Como el ángulo de filo lateral está consiguiendo virutas más grandes está consiguiendo más fino y más de par en par (refiera a izquierdo representan). En la misma alimentación y profundidad del corte con grueso de la viruta del ángulo de acercamiento 0° es igual que la anchura de la alimentación (t=fn) y de la viruta es igual a la profundidad del corte (W=ap)

$$t_1 = 0.97t, W_1 = 1.04W$$

$$t_2 = 0.87t, W_2 = 1.15W$$

① Ángulo Aproximación 0°    ② Ángulo Aproximación 15°    ③ Ángulo Aproximación 30°

### ● Ángulo de filo lateral y 3 fuerzas de corte

#### Afecta

1. El ángulo de filo lateral grande con la misma alimentación hace la viruta que ata longitud más de largo y el deluente del grueso de la viruta. De modo que las fuerzas de corte dispersen al filo largo por lo tanto la vida de la herramienta consigue más de largo
2. Ángulo de filo lateral grande par alas barras largas que trabajan a máquina pueden causar el doblez

#### Selección de sistema

1. Profundidad de corte en acabado/Pieza de trabajo fino/baja rigidez en la maquina - Ángulo de relieve bajo
2. Poder calorífico alto y duro/Pieza de trabajo de gran desbaste/Pieza de trabajo de alta rigidez- alto Ángulo de relieve

- **Pieza de trabajo :** SCM440 (HB250)
- **Grado:** TNGA220412
- **vc:** 100 mm/min
- **ap:** 4 mm
- **fn:** 0.45 mm/rev

● Ángulo de filo lateral y carga del corte

① La fuerza "P" es bloqueada    ② La fuerza "P" es dispersada "P1", "P2"

Mientras que el ángulo de acercamiento consigue una fuerza trasera más grande y la fuerza de la alimentación consigue una fuerza más pequeña

● Ángulo de filo lateral y vida de la herramienta

- Pieza de trabajo: SCM440
- Grado: P20
- $ap$ : 3 mm
- $fn$ : 0.2 mm/rev

● Ángulo de filo lateral y mejoramiento del corte

| Especificación        | Bajo                     | Rango de Acercamiento | Alto                       |
|-----------------------|--------------------------|-----------------------|----------------------------|
| Rango de desgaste     | Alto                     | ←-----→               | Bajo                       |
| Pieza de trabajo      | Corte facil del material | ←-----→               | Material dificil de cortar |
| Energía del máquinado | Corto                    | ←-----→               | Largo                      |
| Chafaneado            | Dificil de cortar        | ←-----→               | Facil de cortar            |
| Cómo máquinar         | Acabado                  | ←-----→               | Desbaste                   |
| Rigidez de la pieza   | Objeto fino y largo      | ←-----→               | Pieza gruesa               |
| Rigidez de la máquina | En caso de baja rigidez  | ←-----→               | En caso de alta rigidez    |

➤ Ángulo de Corte Final

- Afecta a la superficie a máquinar para prevenir interferencia entre la superficie de trabajo y el inserto

Ventajas

1. Si el ángulo de corte final reduce el filo, consiga un filo más fuerte de corte y genere aumentos en máquinado
2. Filode corte pequeño puede causar craterizaciones debidoalos aumentos de fuerza de corte

➤ Nose-R

- El radio de punta "Nose R" no sólo afecta a la aspereza de la superficie, sino tambien a la fuerza del filo
- Es generalmente deseable que el radio de punta "Nose R" sea 2~3 veces más grande que la alimentación

● Radio de punta y superficie de acabado

- Pieza de trabajo: SNCM439, HB200
- Grado: P20
- $vc$ : 120 mm/min
- $ap$ : 0.5 mm

● Radio de Punta y Vida de la Herramienta

- Pieza de trabajo: SCM440, HB280
- Grado: P10
- $vc$ : 100 mm/min,  $ap$ : 0.5 mm
- $fn$ : 0.3 mm/rev

● Radio de Punta y desgaste de la Herramienta

- Pieza de trabajo: SNCM439, HB200
- Grado: P10
- $vc$ : 140 mm/min,  $ap$ : 2 mm
- $fn$ : 0.2 mm/rev, T: 10 min

## 🔄 Nose-R

### Afecta

1. Un radio "R" grande mejora la superficie de acabado
2. Un radio "R" grande mejora la fuerza del filo
3. Un radio "R" grande reduce el desgaste del filo
4. Un radio "R" demasiado grande causa el rechinido debido a la fuerza de corte creciente

### Selección de sistema

1. Para acabados con baja profundidad de corte/pieza larga y fina/ cuando el poder de maquinado es lento - Radio de punta pequeño "R"
2. Para usos que necesitan filo fuerte tal como maquinado intermitente/ para desbaste de piezas grandes/cuando la energía del máquinado es bastante fuerte - Radio de punta grande "R"

## ● Relación entre Radio de Punta y Alimentación

| Radio de Punta / Avance (mm/rev) | 0.4 | 0.8 | 1.2 |
|----------------------------------|-----|-----|-----|
| 0.15                             |     |     |     |
| 0.26                             |     |     |     |
| 0.46                             |     |     |     |

## 🔄 Forma del Filo y sus Afectaciones

### ● Ángulo de Incidencia ( $\alpha$ )

El ángulo de incidencia tiene influencia grande el fuerza de corte, flujo de la viruta y vida de la herramienta

### Afecta

1. Altos resultados del ángulo de incidencia dan buena superficial final
2. El ángulo de incidencia aumenta en la energía que trabaja a máquina 1°, disminuya el 1%
3. El alto ángulo de incidencia debilita el filo

### Selección de sistema

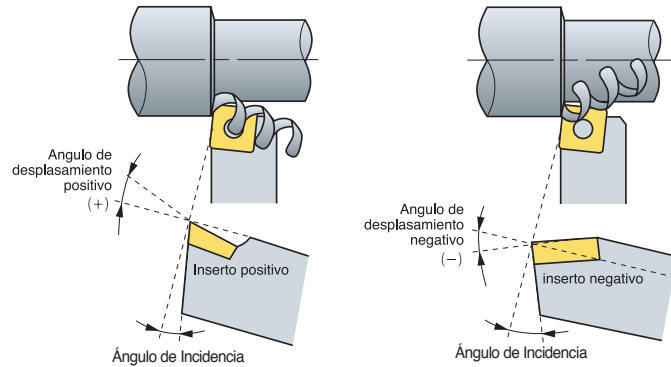

1. Para el objeto duro/Para los usos que necesitan el filo fuerte tal como escala de molino interrumpida y que trabaja a máquina - Bajo Ángulo de incidencia
2. Para el objeto suave/Fácil de cortar/Cuando la rigidez de la energía y de la pieza de trabajo es baja -Alto Ángulo de incidencia.

● **Ángulo de incidencia y control de virutas**

Para prevenir que en la superficie trabajada se dañe. Evite la combinación Negativa-Positivay  $\gamma$  :nega(-)  $\lambda$  :posi(+)

➤ **Selección por Herramienta**

- Hoy en día, es muy difícil seleccionar las mejores herramientas de corte, el sistema de maquinado y las condiciones del corte mejores. Sin embargo, puede ser simplificado clasificando los factores básicos

● **Selección del insertos y portaherramientas**

Se enumeran abajo los factores básicos, elija B según A

**A: Factores Basicos**

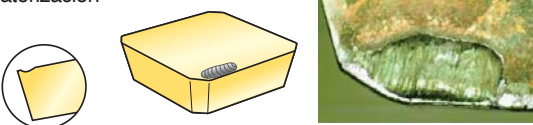

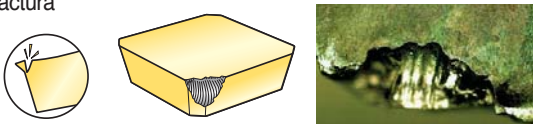

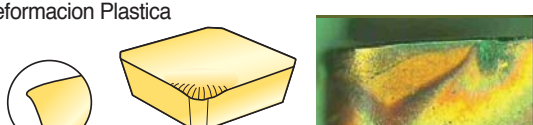

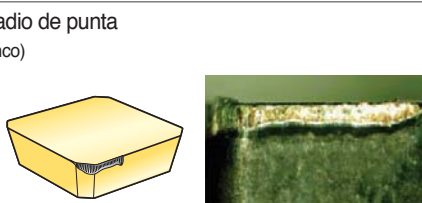

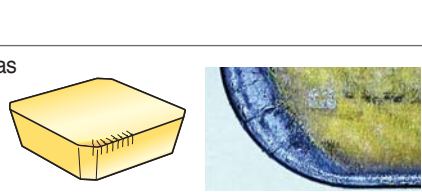

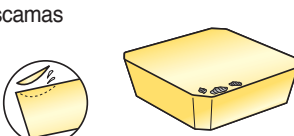

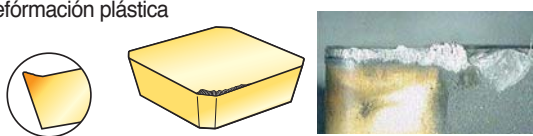

- Material de trabajo
- Forma de la pieza
- Tamaño de la pieza
- Dureza de la pieza
- Desbaste de la pieza (antes de maquinar)
- Acabado de superficie requerido
- Tipo de maquinaachine
- Condicion de la maquina (rigidez, poder etc)
- Hp de la maquina
- Sistema de sujecion con brida

**B: Sistema de Selección**

- ① Selección el mejor ángulo de incidencia como sea posible
- ② Selección el mayor zanco como sea posible
- ③ Seleccione el mayor filo de corte del inserto
- ④ Selección el mayor radio de punta
- ⑤ En Acabado, Selección el inserto con mas filos de corte
- ⑥ Selección el inserto mas pequeño
- ⑦ La velocidad del corte se debe determinar cuidadosamente según condiciones del corte
- ⑧ Selección la profundidad de corte según requiera
- ⑨ Selección el avance segu requiera
- ⑩ La condición del corte debe ser resuelta dentro de gamas del uso de la rompeviruta

## Localización de Averías

| Fallas de la herramienta  | CaUsO  | Solution  |
|---|--|---|

● ISO (B8688)

| Criterio de Vida en la herramienta                                    | Aplicación  |
|---|---|
| Fractura  | Maquinado especial para acero                     |
| Anchura del desgaste en Flanco VB = 0.3 mm                            | Incluso en el desgaste del flanco de los carburos |
| VBmax = 0.5 mm  | Desgaste desigual del flanco                      |
| Anchura de Desgaste KT = 0.06+0.3fmm (f:mm/rev)                       | Herramienta de carburos cementados                |
| Criterio Asperesa Superficial 1, 1.6, 2.5, 4, 6.3, 10 <sup>μ</sup> Ra | Cuando el desbaste superficial es importante      |

## Forma y Código del Cortador de Fresado

### Terminología y funciones del Ángulo de corte

| No. | Falla de Herramienta                    | Símbolo | Función  | Efectos   |
|-----|---|---------|--|---|
| 1   | Ángulo de incidencia axial              | A.R     | Sentido de flujo de la viruta, Adherencia              | Postivo: corte excelente, prevención del filo de adicción   |
| 2   | Ángulo de Incidencia radial             | R.R     | Afectación en el empuje                                | Negativo: Excelente control de viruta   |
| 3   | Ángulo de acercamiento                  | A.A     | El grueso de la viruta, determina el sentido del flujo | (+): El grueso de la viruta llega a ser más fino, fuerza de corte podría ser reducido   |
| 4   | Ángulo de incidencia verdadero          | T.A     | Ángulo de incidencia Eficaz                            | (+): Un mejor corte. Prevención de la Adherencia, fuerza de debilitamiento del filo<br>(-): La fuerza del filo aumenta, difícil Adherencia del material al filo |
| 5   | Ángulo de inclinación del filo de corte | I.A     | Determina el sentido del flujo de la viruta            | (+): El buen flujo de la viruta, disminuciones de la fuerza de corte, la fuerza de la esquina del borde se debilita   |
| 6   | Ángulo de inclinación                   | F.A     | Azperesa superficial que controla el acabado           | Rugosidad de superficie incrementa a medida que F.A. se acerca a los $0^{\circ}$  |

Características de la combinación del Ángulo de Incidencia

|                    | Doble Ángulo Positivo  | Doble Ángulo Negativo   | Ángulo Positivo - Negativo   | Ángulo Negativo - Positivo  |
|--------------------|--|---|--|---|
| <b>División</b>    |  |   |  |   |
| <b>Uso</b>         | <ul style="list-style-type: none"> <li>Maquinado general en acero, fundición, acero inoxidable</li> <li>Para maquinar acero blando, que puede producir filo de aportación fácilmente</li> <li>Para maquinar materiales con superficies pobres</li> </ul> | <ul style="list-style-type: none"> <li>Para condiciones de intermitencia</li> <li>Desbastado de fundición y acero</li> </ul>  | <ul style="list-style-type: none"> <li>Para maquinar materiales difíciles de cortar, como acero inoxidable, acero para moldes</li> <li>Para desbastado profundo en acero y fundición de acero</li> </ul> | <ul style="list-style-type: none"> <li>Cuando la viruta fluye hacia el centro del cortador</li> </ul>   |
| <b>Ventajas</b>    | <ul style="list-style-type: none"> <li>Logra un buena acabado de superficie aun en materiales blandos con tendencia al filo de aportación</li> <li>Por su baja carga de corte, se obtiene un corte sin dificultades</li> </ul>                           | <ul style="list-style-type: none"> <li>Filo de corte fuerte</li> <li>Apropiado para desbastado en malas condiciones de superficie, (como arena, aceite, etc)</li> <li>Muy económico, ambas caras del inserto son funcionales</li> <li>Buen control de viruta</li> </ul> | <ul style="list-style-type: none"> <li>Buen flujo de viruta, fácil de maquinar.</li> <li>Recomendable para maquinar materiales difíciles de cortar</li> </ul>  | -   |
| <b>Desventajas</b> | <ul style="list-style-type: none"> <li>Filo de corte frágil</li> <li>Inserto de una cara únicamente</li> <li>La máquina y el cortador deben tener la suficiente potencia y rigidez</li> </ul>  | <ul style="list-style-type: none"> <li>La máquina y el cortador deben tener la suficiente potencia y rigidez</li> </ul>   | <ul style="list-style-type: none"> <li>Inserto de una cara únicamente (No economicos)</li> </ul>   | <ul style="list-style-type: none"> <li>Ya que las virutas fluyen hacia el centro del cortador, se puede raspar la superficie ya maquinada</li> <li>Mal flujo de viruta</li> </ul> |

Formulas de Corte

● Velocidad de Corte

$$vc = \frac{\pi \cdot D \cdot n}{1000} \text{ (m/min)}$$

- vc : Velocidad del corte (m/min)
- D : Diámetro de la herramienta (mm)
- n : Revolución por el minuto (min<sup>-1</sup>)
- π : Constante de la circular (3.14)

● Avance

$$fz = \frac{vf}{z \cdot n} \text{ (mm/t)}$$

- fz : Avance por diente (mm/t)
- vf : Avance por minuto (mm/min)
- n : Revolución por minuto (min<sup>-1</sup>)
- z : Numero de dientes

● Cantidad de retiro de viruta

$$Q = \frac{L \cdot v_f \cdot a_p}{1000} \text{ (cm}^3\text{/min)}$$

- Q : Cantidad del retiro de la viruta (coif/min)
- L : Anchura del corte (milímetro)
- vf : Alimentación de la tabla (mm/min)
- ap : Profundidad del corte (milímetro)

● Poder Requerido

$$P_{kw} = \frac{Q \cdot k_c}{60 \times 102 \times \eta} \quad P_{hp} = \frac{P_{kw}}{0.75}$$

- Pc : Requisito de energía (kilovatio Kw)
- H : Requisito de energía de caballo (HP)(mm/min)
- Q : Cantidad del retiro de la viruta (cm<sup>3</sup>/min)
- kc : Resistencia específica del corte (kgf/mm<sup>2</sup>)
- η : Machine efficiency rate (0.7-0.8)

● Tiempo de Maquinado

$$T = \frac{60 \times L_t}{v_f} \text{ (sec)}$$

- T : Tiempo que trabaja a máquina (sec)
- Lt : Longitud total de la alimentación de la tabla (mm)(=Lw+D+2R)
- Lw : La longitud del objeto (milímetros)
- D : El diámetro del cuerpo del cortador (milímetro)
- vf : Avance Tabla (mm/min)
- R : ongitude de Incudencia (mm)

● Ángulo de inclinación del Filo

Ángulo de incidencia Real  $\tan(T) = \tan(R) \times \cos(AA) + \tan(A) \times \sin(C)$   
 Ángulo de Inclinación del Filo  $\tan(I) = \tan(A) \times \cos(AA) - \tan(R) \times \sin(C)$

## Valores de la resistencia específica del corte

| Pieza de trabajo                        | Fuerza Tensible (kg/mm <sup>2</sup> ) y dureza | Resistencia específica del corte según la varia alimentación kc (MPa) |            |            |            |            |
|---|--|---|------------|------------|------------|------------|
|   |  | 0.1 (mm/t)  | 0.2 (mm/t) | 0.3 (mm/t) | 0.4 (mm/t) | 0.6 (mm/t) |
| Acero suave                             | 52   | 220   | 195        | 182        | 170        | 158        |
| Acero de carbón medio                   | 62   | 198   | 180        | 173        | 160        | 157        |
| Acero de alto carbón                    | 72   | 252   | 220        | 204        | 185        | 174        |
| Acero de herramienta                    | 67   | 198   | 180        | 173        | 170        | 160        |
| Acero de herramienta                    | 77   | 203   | 180        | 175        | 170        | 158        |
| Acero de manganeso del cromo            | 77   | 230   | 200        | 188        | 175        | 166        |
| Acero de manganeso del cromo            | 63   | 275   | 230        | 206        | 180        | 178        |
| Acero de molibdeno del cromo            | 73   | 254   | 225        | 214        | 200        | 180        |
| Acero de molibdeno del cromo            | 60   | 218   | 200        | 186        | 180        | 167        |
| Acero de molibdeno del cromo del níquel | 94   | 200   | 180        | 168        | 160        | 150        |
| Acero de molibdeno del cromo del níquel | HB352  | 210   | 190        | 176        | 170        | 153        |
| Acero de molde                          | 52   | 280   | 250        | 232        | 220        | 204        |
| Fundicion endurecida                    | HrC46  | 300   | 270        | 250        | 240        | 220        |
| Fundicion Meehanite                     | 36   | 218   | 200        | 175        | 160        | 147        |
| Fundicion gris                          | HB200  | 175   | 140        | 124        | 105        | 97         |
| Latón                                   | 50   | 115   | 95         | 80         | 70         | 63         |
| Aleación ligera (Al - Mg)               | 16   | 58  | 48         | 40         | 35         | 32         |

## Clasificación del desgaste superficial

| Tipo  | Símbolo          | Descripción   | Diagrama |
|---|------------------|---|----------|
| Altura Máxima   | R <sub>max</sub> | <ul style="list-style-type: none"> <li>La distancia entre lo alto de la línea de pico de perfil y el fondo de la línea de valle de perfil en esta porción ejemplificada es medido en la dirección magnífica y longitudinal de la curva de tenacidad (Expresado por unidad μ)</li> <li>Excluir extraordinariamente valores ( tan pequeño o grande) que se parece a ranuras o montañas</li> </ul> |          |
| Medición del acabado de superficie en 10 puntos         | R <sub>z</sub>   | <ul style="list-style-type: none"> <li>Ejemplificado por la curva de tenacidad en la dirección de su línea media, la suma de el valor de promedio de valor absoluto de lo más alto pico de perfil y la profundidad de cinco profundos valles de perfil medidos en el magnificador vertical es expresado por micro metro (μ)</li> </ul>  |          |
| Medición del acabado de superficie por promedio central | R <sub>a</sub>   | <ul style="list-style-type: none"> <li>jemplificar solamente la longitud de referencia desde la curva de tenacidad en la dirección de línea media, tomando X-axis en la dirección de línea media y Y-axis en la dirección de magnificador longitudinal de esta ejemplificada parte y es expresado por mro metro (μ)</li> <li>Generalmente, leer el valor medido por Ra medidor</li> </ul>       |          |

| Símbolo                 |                  | ▽▽▽▽ | ▽▽▽  | ▽▽   | ▽    | ~               |
|-------------------------|------------------|------|------|------|------|-----------------|
| Rugosidad de superficie | R <sub>max</sub> | 0.8s | 6.3s | 25s  | 100s | Sin Especificar |
|                         | R <sub>z</sub>   | 0.8z | 6.3z | 25z  | 100z |                 |
|                         | R <sub>a</sub>   | 0.2a | 1.6a | 6.3a | 25a  |                 |

## Selección del diámetro de MILL-MAX (D)

### Selección por Rigidez del Maquinado

| Hp de la Maquina (PS)                                 | 10~15    | 15~20     | Over 20   |
|---|----------|-----------|-----------|
| Especificación apropiada del cuerpo del cortador (mm) | Ø80~Ø100 | Ø125~Ø160 | Ø160~Ø200 |

### Selección por Rigidez de la Maquina

| Hp de la Maquina (PS) | E             | δ     |
|-----------------------|---------------|-------|
| Acero                 | +20°~10°      | 3 : 2 |
| Fundicion             | menos de +50° | 5 : 4 |
| Aleacion Ligera       | menos de +40° | 5 : 3 |

D : Diámetro externo del cuerpo del cortador

D1 : Anchura del objeto

d : Parte proyectada del cuerpo del cortador

E : Dedique el ángulo

δ : Cociente del cuerpo del cortador y anchura del objeto (D: D1)

### Selección por tiempo de maquinado

Mientras mas grande el cortador, mas largo el tiempo de maquinado

### Selección por num. de diente

| Pieza  | Acero      | Fundicion | Aleacion Ligera |
|--------|------------|-----------|-----------------|
| Diente | Dx (1~1.5) | Dx (1~4)  | Dx1+a           |

ex) D = ø100 ⇒ 4" x (1~1.5) = 4~6

D es el tamaño del volador convertido a pulgadas

## Localización de Problemas en Fresado

| Problema                         | Razones   | Soluciones           |                |        |              |                         |                      |                  |                   |             |                   |        |   |
|----------------------------------|---|----------------------|----------------|--------|--------------|-------------------------|----------------------|------------------|-------------------|-------------|-------------------|--------|---|

### Diferencia entre Endmills de uso genetal y de Alta Velocidad

| Endmills de uso General   |  | Endmills de Alta Velocidad |  |
|---------------------------|--|----------------------------|--|
| Forma Seccion Transversal | Características  | Forma Seccion Transversal  | Características  |
|                           | - Aplicable para baja velocidad/<br>Alta profundidad de corte<br>- Baja dureza de la pieza (Acero Fundicion) |                            | - Aplicable para alta velocidad/<br>Alta profundidad de corte/avance alto<br>- Para Piezas endurecidas |

### Calculo de condiciones de corte

#### Calculo de Velocidad de Avance

$$vc = \frac{\pi \times D \times n}{1000} \quad n = \frac{1000 \times vc}{\pi \times D}$$

#### Calculo de Velocidad de Avance

$$vf = n \times fn \text{ or } n \times fz \times z$$

$$fn = \frac{vf}{n} \quad fz = \frac{fn}{z} \text{ or } \frac{vf}{n \times z}$$

vc: Vel. de corte (m/min)  
 n: Constante circular (3.141592)  
 D: Diametro Endmill (mm)  
 n: R.P.M. (min<sup>-1</sup>)  
 vf: Vel. de avance (m/min)  
 fn: Avance \*revolucion (mm/rev)  
 fz: Avance \*min (mm/t)  
 z: Numero de flautas

### Calculo de condiciones de corte (Endmills Esfericos)

|  |   |
|--|---|
| Revolucion por minuto                  | $n = \frac{vc \times 1000}{D \times \pi}$   |
| Velocidad de Corte                     | $vc = \frac{D \times \pi \times n}{1000}$   |
| Avance por diente                      | $fz = \frac{vf}{z \times n}$  |
| Cance por revoluciones                 | $fn = fz \times z$  |
| Velocidad de Avance                    | $vf = fz \times z \times n$   |
| Indice de retiro de virutas            | $Q = ae \times ap \times vf$  |
| Diametro efectivo del endmill esferico | $D_{eff} = 2 \times \sqrt{D \times ap - ap^2}$ <small>Tabla de cálculo</small><br>$D_{eff} = D \times \sin \left[ \beta \pm \arccos \left( \frac{D - 2ap}{D} \right) \right]$ |

## Ventajas de la Longitud de Flautas

### ● Índice de Expresión del Cocien

- Relación Aspecto
- $l/d$
- Ex) 3D, 15D, 22D

### ● Índice de Deformación según la longitud

- Índice de deformación según la longitud
- El índice de deformación es fuerza de reacción contra fuerza externa
- Fije la longitud de la flauta y la largura total tan cortas como sea posible
- Mas flautas, mayor rigidez
- Cuando la flauta es mas estrecha, mas rígida sera

$\delta$  = Volumen de deformación  $l$  = Longitud de Corte

$P$  = Fuerza de Corte  $E$  = Coeficiente de elasticidad

$$I = \text{Momento inercial} \left( I = \frac{\pi d^4}{64} \right)$$

•  $l: 2l$

•  $\delta_1: \delta_1 = 8\delta_1 = \delta_2$

## Tabla de conversión de R.P.M. - diametro externo

| vc<br>Externo | Velocidad de Corte (vc, m/min) |        |        |        |        |         |         |         |         |         |         |         |         |         |         |         |
|---------------|--------------------------------|--------|--------|--------|--------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|---------|

## Forma de las brocas y nomenclatura

## Forma y Características del Corte

| <b>Ángulo de Hélice</b>     | <p>Juegue con el ángulo de incidencia del filo, si la fuerza de corte aumenta el ángulo de la hélice disminuye.. Por una parte si el ángulo de hélice es demasiado grande la rigidez del taladro disminuye.</p> <p>Manufacturabilidad Pobre ◀ Bajo - Ángulo de Hélice - Alto ▶ Evacuación lisa de la viruta<br/>                 Pieza dura (de acero templado) ◀ Bajo - Ángulo de Hélice - Alto ▶ Material suave (aluminio, etc)</p>  |   |  |                |               |               |  |  |  |               |  |   |                   |
|-----------------------------|--|---|--|----------------|---------------|---------------|--|--|--|---------------|--|---|-------------------|
| <b>Longitud Flauta</b>      | <p>La trayectoria del lubricante de la evacuación y del enfriamiento de la viruta. La longitud demasiado grande de la flauta debilita rigidez del taladro y la longitud demasiado pequeña de la flauta empeora la evacuación de la viruta a la fractura.</p>   |   |  |                |               |               |  |  |  |               |  |   |                   |
| <b>Ángulo de Punto</b>      | <p>El ángulo de punto tiene influencia grande en funcionamiento del corte. Depende principalmente del objeto. En caso de los taladros estándar el ángulo de punto es generalmente 118</p> <p>Disminución de la resistencia del empuje ◀ Bajo - Ángulo de Hélice - Alto ▶ Aumento del aresistencia del empuje<br/>                 Aumento de la torsion y de rebabas en la salida ◀ Bajo - Ángulo de Hélice - Alto ▶ disminución de la torsion y rebabas de salida<br/>                 Material suave (aluminio, etc.) ◀ Bajo - Ángulo de Hélice - Alto ▶ Pieza dura (acero templado)</p>   |   |  |                |               |               |  |  |  |               |  |   |                   |
| <b>Margen</b>               | <p>Mientras que trabajar a máquina el margen es la parte del contacto entre el objeto y el externo del taladro. Evita el doblez desempeña el papel de la guía. Depende de tamaño del taladro</p> <p>Disminución de la fuerza de corte ◀ Pequeño - Margen - Amplio ▶ Incremento de las fuerzas de corte<br/>                 Guia pobre ◀ Pequeño - Margen - Amplio ▶ Buena guia</p>  |   |  |                |               |               |  |  |  |               |  |   |                   |
| <b>Espesor</b>              | <p>Es la parte del centro del taladro y la rigidez del taladro depende de la tela. El taladro necesita el filo, borde del cincel, en la extremidad del taladro porque el taladro hace un agujero al principio de la perforación. Cuando el grueso de la tela es reducción grande es necesario reducir la fuerza de corte</p> <p>Disminución de fuerza de corte ◀ Pequeño - Espesor - Amplio ▶ Aumento de la fuerza de corte<br/>                 Disminución de la rigidez ◀ Pequeño - Espesor - Amplio ▶ Aumento en la rigidez<br/>                 Buena Evacuación de la viruta ◀ Pequeño - Espesor - Amplio ▶ Mala evacuación de las virutas<br/>                 Material suave (aluminio, etc.) ◀ Pequeño - Espesor - Amplio ▶ Pieza dura (acero templado)</p>   |   |  |                |               |               |  |  |  |               |  |   |                   |
| <b>Forma conica Trasera</b> | <p>Tamaño del taladro de diámetro es más pequeño desde el punto de cañara para evitar la fricción entre la periferia de perforación y la pieza de trabajo. La disminución del diámetro dividido por 100mm de longitud de la flauta en general, se convierte en 0.04~0.1mm. En cuanto a los ejercicios de alto rendimiento y los ejercicios de contracción de la pieza del agujero durante la operación tienen la forma cónica de nuevo grande</p>  |   |  |                |               |               |  |  |  |               |  |   |                   |
| <b>Reducción</b>            | <p>En general, los ejercicios de empuje efectos de cincel más del 50% de la longitud del borde de cincel depende de espesor del alma y del ángulo del cincel. Pero si espesor del alma es delgado rigidez de perforación se debilitan. Por lo tanto sin espesor del alma hace que el borde del cincel de un ángulo de inclinación corto. En otras palabras la disminución hace ángulo de inclinación en el cincel, la evacuación de la viruta y el empuje de dealojo mejoren</p> <table border="1"> <thead> <tr> <th>Tipos de</th> <th>Forma del borde</th> <th>Característica</th> <th>Brocas Korloy</th> </tr> </thead> <tbody> <tr> <td><b>Tipo X</b></td> <td></td> <td>Buen centro Alta dureza central<br/>Para Cigüeñales</td> <td>Mach solid drill (MSD)<br/>Vulcan drill (VZD)</td> </tr> <tr> <td><b>Tipo S</b></td> <td></td> <td>Para Uso Amplio Para uso General<br/>facil reafilado</td> <td>Solid drill (SSD)</td> </tr> </tbody> </table> | Tipos de  | Forma del borde                              | Característica | Brocas Korloy | <b>Tipo X</b> |  | Buen centro Alta dureza central<br>Para Cigüeñales | Mach solid drill (MSD)<br>Vulcan drill (VZD) | <b>Tipo S</b> |  | Para Uso Amplio Para uso General<br>facil reafilado | Solid drill (SSD) |

## Precauciones

### Selección del Chuck

- Usar adaptador portapinzas, porque tiene agarre es más seguro (El adaptador de perforación general no tiene suficiente poder de agarre)

### Con Refrigeración

- Debera tener suficiente refrigerante en torno a la entrada del agujero a una presión adecuada
- Presion Estándar de lubricante: 3~5kg/cm<sup>2</sup>, Con un flujo: 2~5 l/min

- Suministre gran cantidad de refrigerante en la entrada del agujero

### Montaje de la Broca

- El montaje debe estar dentro de 0.02mm
- La flauta no debiera de sujetarse

### Sujecion de la Pieza de Trabajo

- Para una mejor perforación de alto rendimiento de empuje y fuerza de corte horizontal, la pieza debe sujetarse firmemente para evitar rechinidos

- Una sujecion fuerte es nescesaria (Laterales, superior e inferior)

- Fuerza de sujeción es necesaria porque puede provocarse astillamiento por fricción

## Nota

- 1) Para mejor vida del taladro, si el desgaste es pequeño es favorable para ser rectificad
- 2) Los daños y el tamaño de desgaste deben estar dentro de 1.5mm para el rectificad
- 3) Si la broca se ha quebrado, el reafilado sera imposible.
- 4) Solicitud de rectificadon es aceptable o la compra de una maquina de rectificadon.

## Proceso de Re-afilado (MACH drill)

### Procedimiento para el reafilado

#### 1) Preparación

- Determinación de las zonas rectificadas. compruebe que el filo muestra daños y desgaste Si la fractura se que se encuentra es grande, quitea limando

#### 2) Operacion de rectificadon

- Ejercicios perforación se sujeta a la pinza de sujeción La vibración debe estar dentro de 0.02mm

**3) Operación de Rectificado Operación**

- Compruebe el daño y el desgaste en el punto y quitelo totalmente
- La diferencia de la altura del labio será de 0.02mm

Ángulo de punto (a): 140°

Ángulo de incidencia (b): 8°~15°

La diferencia de la máxima altura del labio. 0.02mm

**4) Rectificado Operación de Rectificado - Reducción del punto de pulido**

- Considerando la anchura del filo N/L desde centro de la helice debe tener 0.03~0.08mm de margen axial
- Fije la rueda al eje del taladro en un Ángulo de 34°~40°

Ángulo de reducción (a): 155°~160°

reducción Ángulo (b): 100°~105°

Ángulo Reducción Incidencia (c): 34°~40°

**5) Rectificado - N/L Pulido y Afilado**

- Usando el cincel diamante afila la anchura plana a lo largo del filo del punto
- Después pula los bordes para enparejar el filo

Anchura N/L (a): 0.05mm~0.16mm / Ángulo N/L (b): 24°~26°

**TIP**

- Marca del punto
- La anchura del punto debe estar debajo de 0.10mm
- Condiciones recomendadas para el afilado
- Rueda diamante: 240~400 Malla
- Cincel Diamante: 400~600 Malla
- Piedra diamante: 800~1500 Malla

**Tamaño de perno Socket hexagonal (Sujecion de Tornillo)**

**Medidas y dimensiones del Tornillo**

- Los insertos y sus partes antiguas no son intercambiables
- Buen rendimiento y el uso conveniente de las nuevas brocas indexables brindan mejor calidad y servicio al cliente
