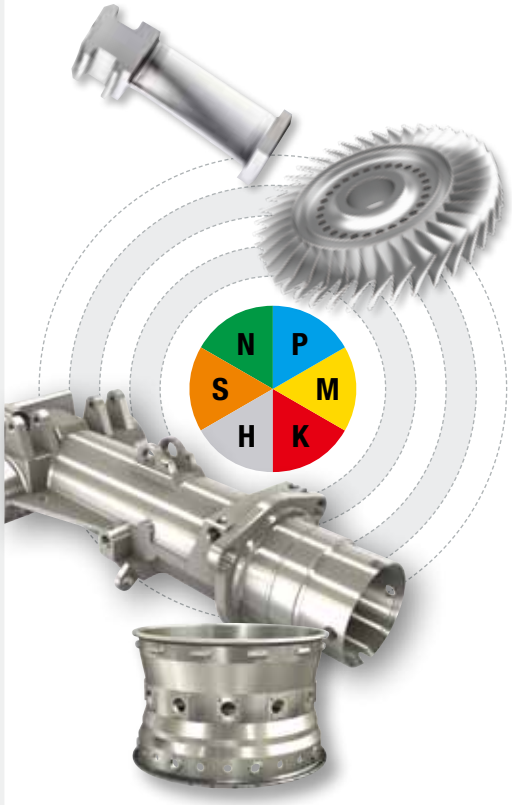
☑ Pre-Checklist for tool selection

Machining operation analysis sequence

- To analyze machining operation, follow the steps mentioned above.
- From tool selection to troubleshooting, refer to the respective chapters for each tool category.
- For inspection criteria regarding workpieces and equipment, please refer to the detailed documentation on the following page.
- If you have any inquiries or questions, please contact the relevant sales office on the last page for a detailed explanation.

1) Workpieces



Workpiece materials

Section	Examples	
Production method	Castings	Selection of casting-specific material
	Forgings	Selection of high hardness grade
Chip shape	Sheared chip	Selection of productivity-enhancing tool (Maximum no. of tooth)
	Built-up chip	Selection of tool with maximum chip pocket capacity and surface treatment
Hardness	High hardness chip	Selection of High Grade + Rough C/B
	Low hardness chip	Selection of Low Grade + Rough C/B
Material	Steel	Selection of Medium C/B + steel specific grade
	STS, HRSA	Selection of Light C/B + hard-to-cut material specific grade

Workpiece shapes

Section	Examples	
Surface	Curved surface	Tools for profiling + Tool interference check
	Flat surface	Tools for facing + maximum machining dia. check
Hole	Shallow hole	Selection of tools with low overhang
	Deep hole	Selection of tools for deep hole cutting
Side wall	Thin side wall	Selection of tools with high fastening stability
	Normal side wall	Selection of general tools for shouldering
Slotting		Selection of tools suitable for slot shape and size

Workpiece tolerance

Section	Examples	
Dimensional accuracy	Roughing	Application of cost-effective tools + coating material
	Finishing	Consideration of applying precision-grade tools + non-coated materials
Surface finish		Consideration of applying wipers + non-coated materials

2) Equipment

Equipment

Section	Examples	
Equipment power	Low horsepower	Selection of low cutting resistant tools
	High horsepower	Selection of high-productivity tools
Equipment stability (Model year, condition)	Good	Reviewing custom tools
	Aged	ISO tool review
Number of axis	General facilities	ISO tool review
	Multiaxial equipment	Using tools with high fastening stability
Clamping workpiece	Wrong clamping	Reassessing equipment clamping status

Tooling System

Section	Examples	
Overhang	Short	Using general tools
	Long	Selection of low approach angle and Anti-vibration tools
Arbor size	Small (BT30)	Application of compact tools with fewer teeth
	Large (BT50)	Selection of high-productivity tools, application of multiple teeth
Run-out	Defect	Checking spindle condition and reviewing equipment overhaul

01) Line-up

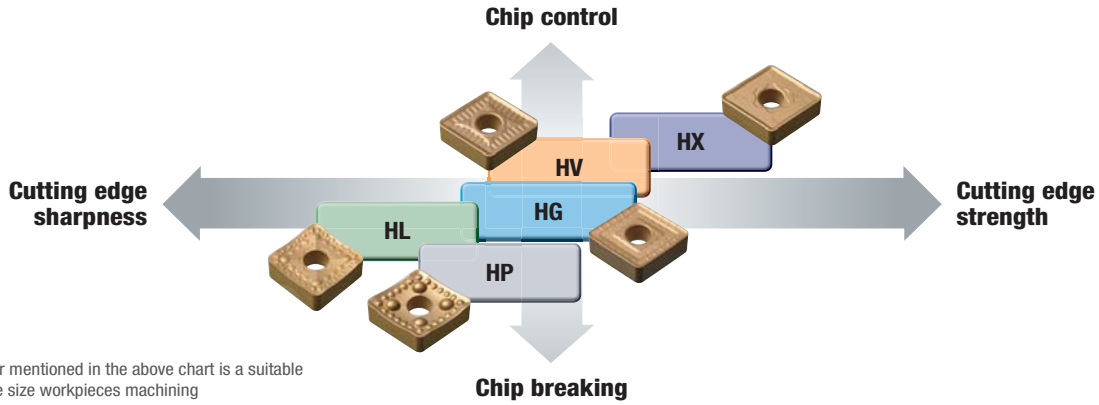
Heavy inserts (For large size workpieces in wind power, ships, railways, etc. industries)



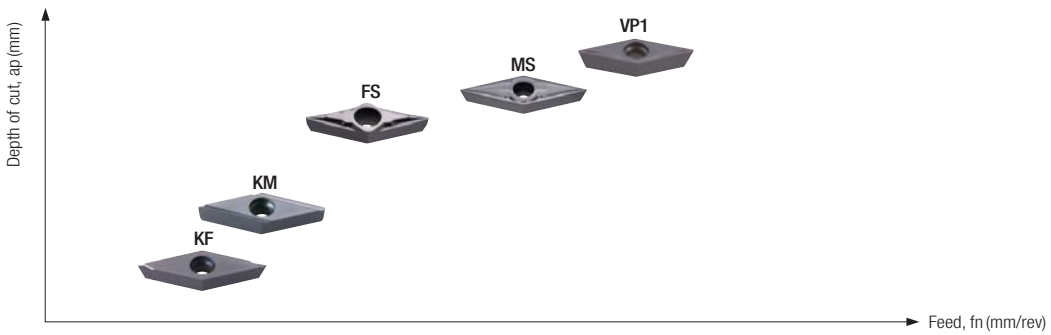
※ The chip breaker mentioned in the above chart is a suitable product for large size workpieces machining
※ Representative insert: CNMM250924

ISO insert (Automobiles, general machinery parts, etc.)

Workpiece	Single- sided insert (Positive)				Double- sided insert (Negative)			
	Finishing	Medium to finishing	Medium cutting	Roughing	Finishing	Medium to finishing	Medium cutting	Roughing
P Coating	FP	VL	MP	C25	VL	LP	MP	GR
P Cermet	FP	VL	MP	C25	VL	VB	VQ	GM
M	FP	VL	MP	C25	VP2	MP	MM	RM
K			MP	C25	MP	B25	MK	RK
S	LU	MU	MP		VP1	VP2	VP3	VP4
N	AK		AM	AR			HA	

※ The table represents chip breakers for different workpiece material types, and the selection of chip breakers based on chip control or toughness issues can be found in detail on the back page.
※ Representative insert: CNMG120408

Small precision machining inserts Auto Tools (Electronics, electricity, medical components, etc.)



※ The product line in the table consists of Auto Tools products for small precision component machining.
※ Representative insert : CCGT09T302.

02) Grade selection guide

1-1 Steel Turning

Workpiece		ISO	Grade - Recommended cutting speed(m/min)							
			Wear resistance ← • → Toughness							
		vc (m/min)	P05	P15	P20	P25	P30	P35	P40	P45
P		400	NC3205 (230 ~480)							
		350		NC3215 (170 ~420)						
		300			NC5320 (150 ~370)					
		250				NC3225 (150 ~370)				
		200					NC3030 (110 ~260)	NC3235 (100 ~280)		
		150						PC5300 (100 ~250)		
		100							PC5400 (80 ~160)	
	Application		Chip breaker (Recommended cutting conditions)							
			Chip control ← • → Strength of cutting-edges							
	Negative	Roughing							HR (0.3 ~0.65)	GR (0.3 ~0.7)
		Medium cutting					VM (0.2 ~0.4)	MP (0.2 ~0.45)	HM (0.25 ~0.5)	
		Medium to finish cutting			VC (0.10 ~0.32)	LP (0.12 ~0.35)	CP (0.12 ~0.38)			
		Finishing	VL (0.05 ~0.25)	VB (0.06 ~0.28)	VF (0.07 ~0.3)					
		wiper						VW (0.15 ~0.50)	LW (0.25 ~0.70)	
	Positive	Roughing						C25 (0.10 ~0.30)		
		Medium cutting				HMP (0.07 ~0.23)	MP (0.08 ~0.25)			
		Finishing	FP (0.02 ~0.10)	VL (0.05 ~0.12)	VF (0.06 ~0.16)					

※ The recommended cutting speed mentioned above is based on SM45C carbon steel.

※ Recommended cutting conditions for different cutting materials and feed rates may be subject to change.

1-2 Steel Turning (Heavy)

* Inscribed circle, 19 or greater

Workpiece		ISO	Grade - Recommended cutting speed(m/min)					
			Wear resistance ← • → Toughness					
		vc (m/min)	P05	P15	P20	P25	P35	P40
P		130	NC3205 (115 ~150)					
		120		NC515H (110 ~135)				
		110			NC520H (100 ~125)			
		100				NC525H (90 ~115)		
		80					NC3235 (70 ~105)	
		40						NCM535 (60 ~95)
	Application		Chip breaker (Recommended cutting conditions)					
			Chip control ← • → Strength of cutting-edges					
	Negative	Roughing						HX (0.6 ~1.5)
		Medium cutting				HG (0.4 ~1.2)	HV (0.5 ~1.4)	
		Medium to finish cutting		HP (0.4 ~1.0)	HL (0.4 ~1.1)			
		Finishing	HD (0.35 ~0.8)					

Workpiece	Workpiece materials	ISO (DIN)	AISI	Cutting conditions (Adjusting cutting speeds for each cutting material based on the reference table by 100%.)		
				Cutting speed (m/min)	Feed	Depth of cut
Carbon steel	C=0.10~0.25%	(C22)	1020	105%	100% (Standard)	100% (Standard)
	C=0.25~0.55%	C45	1045	100% (Standard)		
	C=0.55~0.80%	C55	1055	90%		
Alloy steel	Unhardened	42CrMo4	4140(H)	86%	90%	
	Hardened	42CrMo4	4140(H)	78%		
	High Manganese (12~14% Mn)	22Mn6	1522	65%		

※ The first and second recommended classifications are divided into NC3200 grade for smaller than ISO19, and a separate heavy grade for ISO19 and above.

※ The first and second recommendations are connected via QR codes, providing detailed information on chip breaker lineups.

※ The lineup of recommended grades provides cutting speed information, while the chip breaker lineup provides recommended feed rates and entry conditions.

2 Stainless steel Turning

Workpiece	ISO / vc (m/min)	Application		Grade - Recommended cutting speed(m/min)							
				Wear resistance ← • → Toughness							
				M05	M10	M15	M20	M25	M30	M35	M40
M	250					NC9115 (220~260)					
	200			PC8105 (120~230)				NC9125 (190~230)		NC3235 (180~220)	
	150				PC8110 (110~210)		PC8115/ PC8120 (100~200)	PC5300 (80~190)		NC9135 (160~200)	
	125								PC9035 (70~160) PC9030 (80~180)		
	100									PC5400 (80~140)	
		Chip breaker (Recommended cutting conditions)									
		Chip control ← • → Strength of cutting-edges									
		Negative	Roughing						GS (0.23~0.50)	RM (0.25~0.55)	
			Medium cutting			MP (0.2~0.45)	HS (0.2~0.47)	MM (0.2~0.50)			
			Finishing		VP2 (0.1~0.4)						
		Positive	Roughing						C25 (0.10~0.30)		
			Medium cutting			HMP (0.07~0.23)	MP (0.08~0.25)				
			Finishing	FP (0.02~0.10)	VL (0.05~0.12)						

3 Cast iron Turning

Workpiece	ISO / vc (m/min)	Application		Grade - Recommended cutting speed(m/min)					
				Wear resistance ← • → Toughness					
				K05	K10	K15	K20	K25	K30
K	500			NC6310 (300~500)					
	400					NC6315 (200~400)			
	300						NC5320 (150~330)		
	200							NC5330 (110~270)	
	150					PC8110 (95~180)		PC5300 (75~140)	
	100								PC5400 (65~120)
		Chip breaker (Recommended cutting conditions)							
		Chip control ← • → Strength of cutting-edges							
		Negative	Roughing				VR (0.25~0.65)	RK (0.25~0.7)	MA (0.3~0.7)
			Medium cutting		MK (0.2~0.5)	B25 (0.25~0.55)			
			Medium to finish cutting	MP (0.1~0.45)					
		Positive	Roughing				C25 (0.10~0.30)		
			Medium to finish cutting		MP (0.08~0.25)				

※ Recommended cutting speed above is for austenitic stainless steel STS304 cutting.

※ Recommended cutting conditions for different cutting materials and feed rates may be subject to change.

Workpiece	ISO (DIN)	AISI	Cutting conditions (Adjusting cutting speeds for each cutting material based on the reference table by 100%.)		
			Cutting speed (m/min)	Feed	Depth of cut
Austenitic	X5CrNi 18-9	304	100% (Standard)	100% (Standard)	100% (Standard)
	X5CrNiMo17-12-2	316	100%		
Ferritic, martensitic	-	-	110%	90%	
	X12Cr13	410	105%		
	X6Cr17	430	100%		
Precipitation series	X5CrNiCuNb 16-4	S17400	70%	80%	
Duplex	(X2CrNiMoN22-5-3)	S31803	45%	70%	

※ For large cutting materials (ø300 and above), CVD grades are recommended, while for small cutting materials (ø150 and below), PVD grades are recommended.

Workpiece	ISO (DIN)	AISI	Cutting conditions (Adjusting cutting speeds for each cutting material based on the reference table by 100%.)		
			Cutting speed (m/min)	Feed	Depth of cut
Gray cast iron	250	No35B	100% (Standard)	100% (Standard)	100% (Standard)
	350	No45b	95%		
Nodular SG iron	400-18	60-40-18	94%	90%	
	500-7	65-45-12	90%		
	600-3	80-55-06	85%		
	700-2	100-70-03	82%		

※ The recommended cutting speed mentioned above is based on GC250 gray cast iron.

※ Recommended cutting conditions for different cutting materials and feed rates may be subject to change.

02) Grade selection guide

4 Heat resisting alloy Turning

Workpiece	ISO / vc (m/min)	Grade - Recommended cutting speed(m/min)						
		Wear resistance ← • → Toughness						
		S05	S10	S15	S20	S25	S30	S35
S	80	PC8105 (40~70)						
	70		PC8110 (35~65)					
	60							
	50			PC8115 (30~60)	PC8120 (30~60)	PC5300 (20~60)		
	40			NC9125 (20~60)		PC9035 (30~50)	NC9135 (20~60)	
	30						PC5400 (20~50)	
	Application	Chip breaker (Recommended cutting conditions)						
		Chip control ← • → Strength of cutting-edges						
	Negative – Roughing					VP4 (0.15~0.45)		
	Negative – Medium cutting				VP3 (0.12~0.42)			
	Negative – Medium to finish cutting			VP2 (0.1~0.4)				
	Negative – Finishing		VP1 (0.07~0.2)					
	Positive – Medium cutting				MU (0.07~0.23)	MP (0.08~0.25)		
	Positive – Medium to finish cutting	LU (0.03~0.08)	VP1 (0.04~0.10)	VL (0.05~0.12)				

5 Aluminium Turning

Workpiece	ISO / vc (m/min)	Grade - Recommended cutting speed(m/min)				
		Wear resistance ← • → Toughness				
		N05	N10	N15	N20	N25
N	1200	ND3000/ ND2100 (160~1200)				
	800		PD1005 (160~800)			
	600			PD1010 (160~450)		
	300				H01 (160~300)	
	200					H05 (60~220)
	Application	Chip breaker (Recommended cutting conditions)				
		Chip control ← • → Strength of cutting-edges				
	Negative – Medium cutting			HA (0.1~0.5)		
	Positive – Roughing			AR (0.05~0.5)		
	Positive – Medium cutting		AM (0.04~0.45)			
	Positive – Finishing	AK (0.03~0.4)				

Workpiece	ISO (DIN)	AISI	Cutting conditions (Adjusting cutting speeds for each cutting material based on the reference table by 100%.)		
			Cutting speed (m/min)	Feed	Depth of cut
Ti alloy	Ti-6Al-4V	Ti-6Al-4V	110%	110%	100% (Standard)
Ni series	Inconel625	Inconel625	100% (Standard)	100% (Standard)	
	Inconel718	Inconel718			
Co series	Stellite	Stellite	85%	90%	
Fe series	-	Inconel909			

※ The recommended cutting speed mentioned above is based on Inconel 718, a nickel-based alloy.

※ Recommended cutting conditions for different cutting materials and feed rates may be subject to change.

Workpiece	ISO (DIN)	AISI	Cutting conditions (Adjusting cutting speeds for each cutting material based on the reference table by 100%.)		
			Cutting speed (m/min)	Feed	Depth of cut
Graphite	Graphite	-	110%	100% (Standard)	100% (Standard)
Al alloy	G9GK0-ALi7Mg GD-AlSi10Mg GD-AlSi9Cu3	-	100% (Standard)	90%	
Composite materials	CFRP	-	90%		

※ The recommended cutting speed mentioned above is based on A6061S Al forged alloy.

※ Recommended cutting conditions for different cutting materials and feed rates may be subject to change.

03) Useful cutting tip

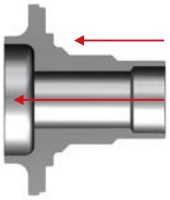
Section	Contents

Hub

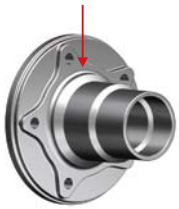
Continuous cutting/ interrupted cutting

1st recommendation
: NC5320

INFO



Internal/ External cutting, etc. (Continuous cutting)
: NC3215



External fins (Low interrupted cutting)
: NC5320

(Heavy interrupted cutting)
: NC3225

Wear resistance

1st recommendation

Toughness

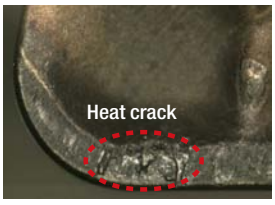
Difference in tool life based on the presence or absence of cutting fluid

Recommendation for dry machining at high cutting speeds

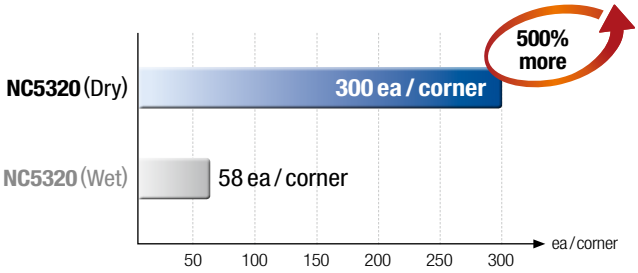
Interrupted and wet cutting

Rapid heating and rapid cooling cycles on cutting tools

Excessive wear by heat impact



Workpiece use	Hub bearing
Workpiece	S55CR
Cutting conditions	vc (m/min) = 250~270 fn (mm/rev) = 0.2~0.35 ap (mm) = 1



03) Useful cutting tip

Section	Contents
Insert fracture/ defect issues during heavy interrupted machining Holder shim replacement	**1) Sudden insert fracture**  **2) Cause of fracture** (excessive wear on shim)  **3) Analysis of fracture causes** (clamping force) **Contact area comparison between worn shim and normal shim** **Worn shim - Unstable clamping**  - Not able to clamp 100% - Occurrence of unstable fastening **Normal shim - Stable clamping**  - Ensuring contact area and improving fastening stability after shim replacement - More than 95% fully secure fastening state
In stainless steel cutting, the application areas of CVD and PVD coatings For large workpieces (Ø300 and above) : CVD coating is preferred. For small workpieces (Ø100 and below) : PVD coating is preferred.	
03) Useful cutting tips - **Cermet**

Section	Contents
Automotive and machinery components (carbon steel and alloy steel - continuous machining of external and internal diameter) **1st recommendation For continuous cutting : CC1015** **1st recommendation For interrupted cutting : CN2500**	 **External diameter** (Continuous cutting) **: CC1015** **External diameter** (Continuous cutting) **: CC1500**  **Slotting / External diameter** (Interrupted cutting) **: CC1025 / CN2500** Wear resistance 1st recommendation Toughness
Automotive components (sintered alloy-interrupted cutting) **1st recommendation : CC1015 CN1500** **2nd recommendation : CC1025 CN2500**	 **Slotting / External diameter** (Continuous cutting) **: CC1015 / CN1500** **Slotting / External diameter** (Interrupted cutting) **: CC1025 / CN2500** 1st recommendation Toughness

Section	TPMT110304	SCMT09T308	SNMG120408	VNMG160408
Cutting speed vc (m/min)	250	200	100 ~ 150	150 ~ 180
RPM n (rpm)	1,650 ~ 2,500	1,650 ~ 2,500	1,650 ~ 2,500	1,650 ~ 2,500
Feed fn (mm/rev)	0.08 ~ 0.12	0.08 ~ 0.12	0.2 ~ 0.25	0.12 ~ 0.3
Depth of cut ap (mm)	0.2	0.4	0.5 ~ 2.0	0.2 ~ 0.4
Diameter and length of workpiece	Smaller than 100mm	Smaller than 100mm	Smaller than 100mm	Smaller than 100mm
Coolant	Wet	Wet	Wet	Wet

- Representative inserts used in sintered alloy components
  - TPMT110304-MP
  - SCMT09T308-HMP
  - TCMT110204-B25
  - SNMG120408-VQ
  - VNMG160408-VF
  - VBMT160404-MP
- To minimize the variation in tool life when machining sintered alloy components, the primary recommendation is to use medium-rough to medium chip breakers.

03) Useful cutting tips - **Heavy cutting**

Section	Contents
1st recommended chip breaker for heavy cutting 1st recommended chip breaker for vertical machining : **HV** 1st recommended chip breaker for horizontal machining : **HG** INFO	**1) In vertical cutting of a flange**  Slotting/external diameter cutting (vertical direction of holders) : 1st recommended **HV** **2) In horizontal cutting of a shaft**  External diameter cutting (horizontal direction of holders) : 1st recommended **HG** **[Chip breaker features]** Rigidity of cutting edge Wear resistance
Cases of insert damage caused by screw issues and solutions Recommended to use genuine screws and holders	• Checking the screw head protrusion → Suspecting the insert attachment condition → Verifying the screw size   Damaged holder  Genuine screw  Fracture or counterfeit screw

Section	Contents	
Undamaged holder + genuine screw	 Stable clamping	 Normal wear
Damaged holder + counterfeit screw	 Wear phenomenon (vibrations)	 Abnormal wear/ fracture

04) Troubles in cutting and solutions

Troubles	Factors	Solutions
Chip jamming The phenomenon where chips do not break so the long chip is tangled around the tools or a workpiece 	→ Selection of a wrong chip breaker for the application area	→ Selection of an appropriate chip breaker that matches the cutting conditions Refer to the tool selection guide p. 7
	→ Too low feed	→ Increased feed 
	→ Low depth of cut	→ Increased depth of cut 	→ Too large nose radius	→ Select smaller nose radius 
	→ Improper lead angle	→ Select a holder with large lead angle or shape Excessive chip fragmentation The excessive formation of very short chips due to high cutting forces, leading to shortened tool life and tool damage 	→ Too high feed	→ Decreased feed 		→ Select a chip breaker designed for higher feed 	→ Too small nose radius	→ Select larger nose radius Built-up-edge/ welding The simultaneous occurrence of burrs and chipping, causing accumulated burrs to detach along with the insert material, resulting in damage 	→ Low speed	→ Optimize the cutting speed 	→ Low feed	→ Optimize the feed 	→ Negative insert shape	→ Select a positive shape 

04) Troubles in cutting and solutions

Troubles	Factors	Solutions
Surface roughness defect Rough surface finish and fail to meet the tolerance requirements 	→ Leaving marks on the surface as chips break towards the workpiece	→ Choose a chip evacuation configuration that discharges chips far away 	→ Rough surface due to notch wear	→ Select a cermet grade 		→ Reduce cutting speed 	→ High feed and too small cutting radius	→ Select a wiper insert or larger nose radius → Lower feed Burr formation The formation of burrs at the end of cutting when the cutting edge deviates from the workpiece 	→ Dull cutting edge	→ Use a sharp insert 
	→ Notch wear on the part of depth of cut	→ Select larger nose radius Vibration Tool scratched the workpiece due to chattering 	→ Improper lead angle	→ Use larger lead angle 	→ Too large nose radius	→ Select smaller nose radius 	→ Excessive front wear of the cutting edge	→ Reduce cutting speed or select a better wear resistance grade 	→ Vibration caused by excessive overhang during steel boring bar usage	→ Using carbide boring bar which has better rigidity than steel boring bar and minimizes vibration during deep machining

04) Useful cutting tip

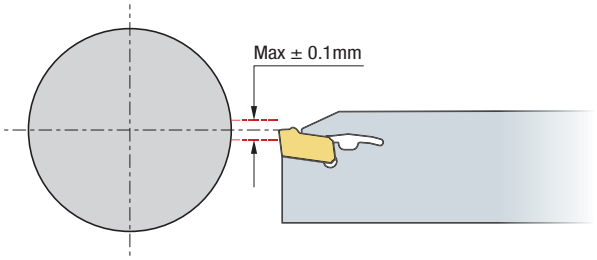
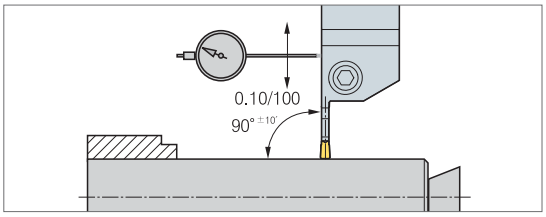
Insert cutting edge height setting

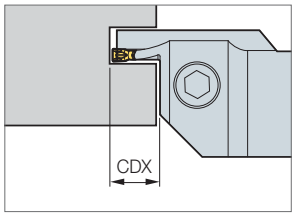
- The insert cutting edge height needs to be set within ±0.1mm from the workpiece center.
- It is recommended to machine as close as possible to the chuck in order to reduce vibration

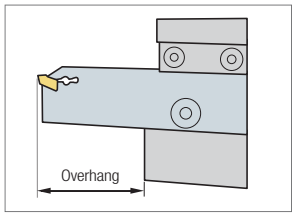


Holder setting method

- To minimize and suppress vibration, the position of the insert's cutting edge should be accurately installed to be parallel or perpendicular to the machining axis.
- The shortest CDX holder should be selected based on the machining depth of the workpiece material being machined.
- Overhang should be set as short as possible for optimal usage.

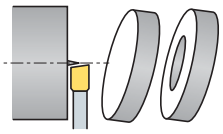




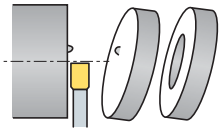


Recommended lead angles for different workpiece types' parting off

- It is possible to minimize chip (PIP) and burr formation by choosing a proper lead angled insert.
- If there is minimal chip and burr formation, it is recommended to use inserts without a positive lead angle.



Hand-type insert



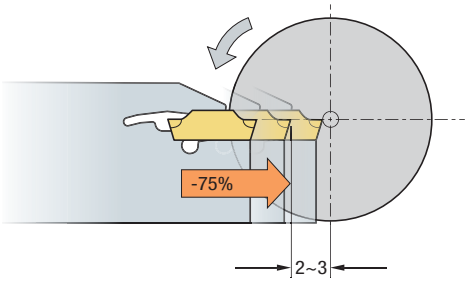
Insert without hand

Applicable workpieces per insert's lead angle	Lead angle 0° (N-type)	Lead angle 4°~ 8°	Lead angle 8°~ 15°
			• 4° - Hollow (pipe) • 6° - Pipe and solid bar • 8° - Solid bar • 15° - Solid bar with small diameter	• For parting off solid bar shaped workpiece • Center stub can be occurred after parting off • Preventing deflection of the parting off direction during machining • Optimized for deep cutting depth machining	• For parting off solid bar shaped workpiece, reducing center stub • For machining applications with hollow bar inserts to minimize burr formation	• For parting off hollow bars with thin cross-sectional thickness • For parting off small diameter workpieces and minimizing burr and center stub

※ Applicable inserts : MGMR/L-□□-Lead angle-PS/PT, KGMR/L-□□-Lead angle-LP/RP

Reducing feed before parting off the center of workpiece

- Tool breakage can be occurred if the tools approaches the workpiece's center with high feed while parting off
- It is necessary to always reduce feed by 75% at a position 2~3mm ahead of the center.
- Lower feed near the center reduces cutting load and decreases the risk of tool breakage.



05 Troubles in cutting and solutions

Troubles	Factors	Solutions			
		Checkpoint 1	Checkpoint 2	Checkpoint 3	Checkpoint 4
Bad surface finish 	Chattering and wrong tool setting	Use a short CDX holder 	Tool setup at 90° 	Use larger Nose R  Larger corner R	Change to another chip breaker Refer to the tool selection guide p. 7
Bad chip control 	Setting improper cutting condition and chip breaker	Increase the feed within recommended cutting conditions 	Machining multiple times with divided cutting depth 	Increase coolant amount and pressure (Recommended inner coolant) 	Change to another chip breaker Refer to the tool selection guide p. 7
Vibration 	Long overhang, wrong setting of holder and lack of holder rigidity	Use a short CDX holder 	Check the center height ±0.1mm from the insert's cutting edge 	Use smaller nose R  Smaller corner R	Use a bigger shank Short tool life 	Selecting improper grade and chip breaker, lower clamping force of holder	Select a proper grade depending on workpiece materials 	Don't use any damaged holders 	Increase coolant amount and pressure (Recommended inner coolant) 	Change to another chip breaker Refer to the tool selection guide p. 7
Fracture of insert 	Put excessive power when clamping an insert, damaged holder and too long overhang	Use a short CDX holder 	Use the provided wrench (prohibited to use a pipe as an extension) 	Remove all debris from the clamping part (chips, coolant oil and etc.) 	Don't use any damaged holders Built-up edge 	Setting improper cutting condition and chip breaker, lack of coolant	Increase the cutting speed and feed within recommended cutting conditions 	Increase coolant amount and pressure (Recommended inner coolant) 	Use smaller nose R  Smaller corner R	Change to another chip breaker Refer to the tool selection guide p. 7

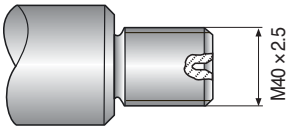
02) Tool selection guide - Thread Turning

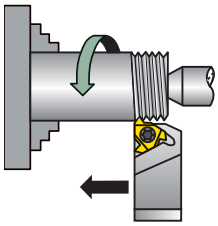
Thread turning steps



Application

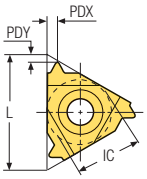
- **Thread** : External right hand ISO metric M40 × 2.5
- **Material** : 4140 (25 HRC)

1 Choose the thread turning method



Use a right hand threading insert with a right hand external threading holder as threading direction is towards the chuck.

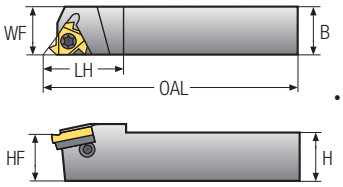
2 Choose the insert size



- **Chosen insert** : ER16-2.5 ISO

Insert size	Pitch	Ordering code	Shim	Tool holder
IC	**mm**	**RH** (Right Hand)	**RH** (Right Hand)	
9.525	2.5	ER16-2.5ISO	ATE16	ERH□□-16

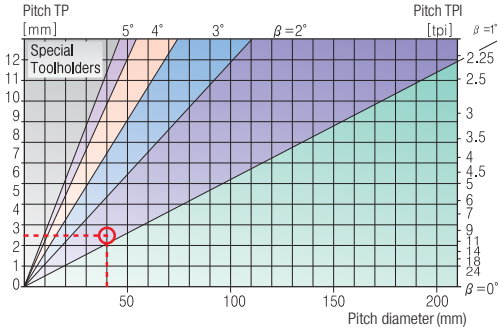
3 Choose the tool holder



- **Chosen tool holder** : ERH25–16

Insert size	Ordering code	Dimensions (mm)				
IC	**RH** (Right Hand)	**H= HF**	**B**	**WF**	**OAL**	**LH**
9.525	ERH25-16	25	25	25	153.6	30

4 Determine the helix angle



- From the table, using a pitch of 2.5 mm (10 tpi) and a workpiece diameter of 40 mm (1.57"), we find the helix angle to be 1.5°

5 Choose the correct shim

Helix angle		1.5°
Insert size	**IC**	9.525
	L	16
Shim designation		ATE16

6 Choose the carbide grade and cutting speed

- **Carbide grade chosen** : PC3030T
- **Cutting speed** : 140m/min

Workpiece			HB	**vc** (m/min)
				PC3030T
P	**Low alloy steel** (alloying elements ≤ 5%)	Non-hardened	180	85~145
		Hardened	275	75~140
		Hardened	350	70~135

7 Determine the number of passes

- **Carbide grade chosen** : PC3030T
- **Cutting speed** : 140m/min

Pitch	mm	1.50	1.75	2.00	2.50	3.00	3.50	4.00
	tpi	16	14	12	10	8	7	6
No.of passes		6~10	7~12	7~12	8~14	9~16	10~18	11~18

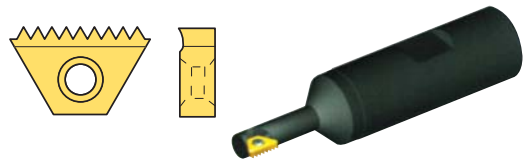
8 Summary

Thread type	ISO M40 × 2.5 External right hand
1. Feed direction	Towards the chuck
2. Insert and grade	ER16–2.5ISO, PC3030T
3. Tool holder	ERH25–16
4. Helix angle	1.5°
5. Shim	ATE16
6. Cutting speed	140 m/min
7. Number of passes	10

02) Tool selection guide - **Thread Milling**

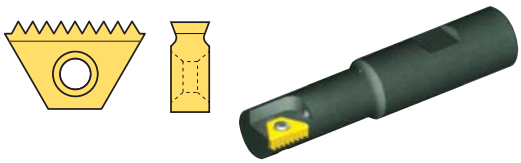
The right tool for the job

Small diameter type



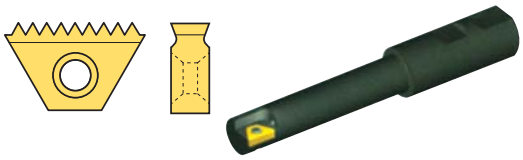
- **Tool holder** : TMSR • **Insert** : TM (L = 10.4 mm)
- For small bore diameters down to 9.5 mm

Standard type



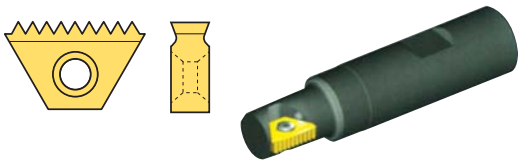
- **Tool holder** : TMSR • **Insert** : TM2
- For standard length threads

Long type



- **Tool holder** : TMSR • **Insert** : TM2
- Long shank thread milling

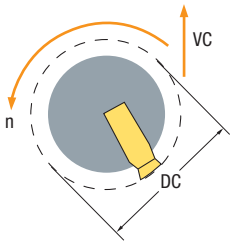
Tapered type



- **Tool holder** : TMSR • **Insert** : TM2 (BSPT, NPT, NPTF)
- Taper thread millings

Preparing for the thread milling operation

(Calculation of rotational velocity and feed at the cutting edge)



$$n = \frac{vc \times 1000}{\pi \times DC}$$

$$vc = \frac{n \times \pi \times DC}{1000}$$

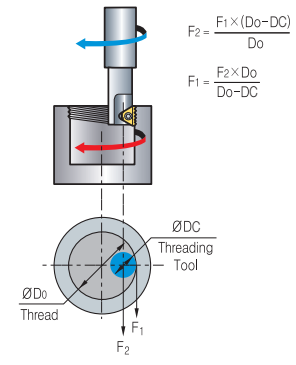
$$F_1 = n \times z \times fn$$

n – Rotational Velocity (min^{-1})
vc – Cutting Speed (m/min)
DC – Tool holder Cutting Dia. (mm)
F_1 – Real Feed rate at the Cutting edges (mm/min)
z – No. of Cutting Edges
fn – Feed per Rooth per Rotation (mm/rev)

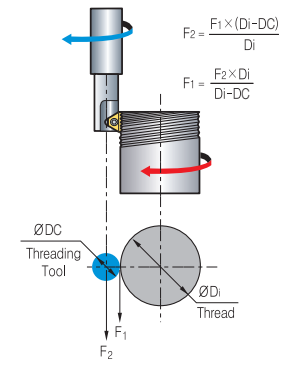
(Calculation of feed rates at the tool center line)

- Feed rate from the center-line of the tools is required for most of the CNC machine's programming. When dealing with linear tool movement, the feed rate at the cutting edge and the center line are identical, but with a milling tool, this is not the case. The value can be defined relatively by the feed rate at the cutting edge and the feed rate at the tool's center-line.

Internal thread



External thread



(Grades and applications)

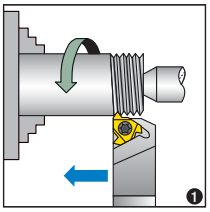
- **Grade** : PC9570T
- **Application** : First Choice for steel and cast iron A tough sub-micron substrate with TiCN coating Provides good fracture toughness and excellent wear resistance

03) Useful cutting tip - Thread Turning

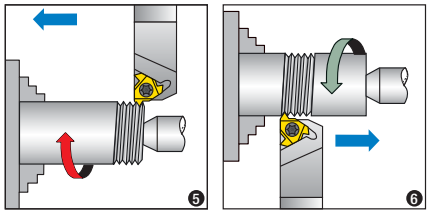
Thread turning method

Thread	Inserts & Tool holder	Rotation	Feed direction	Helix method	Drawing no.
Right Hand External	EX RH	Counter clockwise	Towards chuck	Regular	❶
	EX LH	Clockwise	Outwards chuck	Reversed	❷
Right Hand Internal	EX RH	Counter clockwise	Towards chuck	Regular	❸
	IN LH	Clockwise	Outwards chuck	Reversed	❹
Left Hand External	EX LH	Clockwise	Towards chuck	Regular	❺
	EX RH	Counter clockwise	Outwards chuck	Reversed	❻
Left Hand Internal	IN LH	Clockwise	Towards chuck	Regular	❼
	IN RH	Counter clockwise	Outwards chuck	Reversed	❽

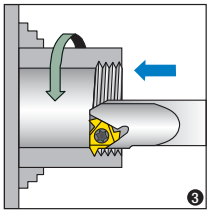
External RH thread



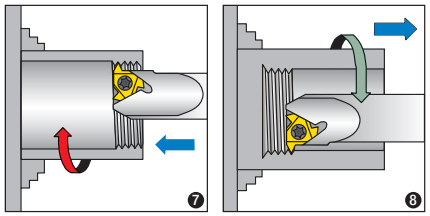
External LH thread



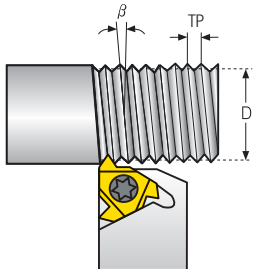
Internal RH thread



Internal LH thread



Calculating the helix angle (β)



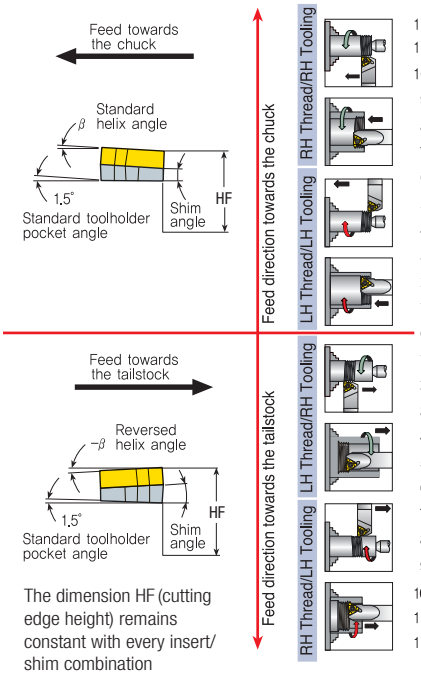
- The helix angle is calculated by the following formula

$$\beta = \tan^{-1}\frac{TP \times N}{\pi \times D}$$

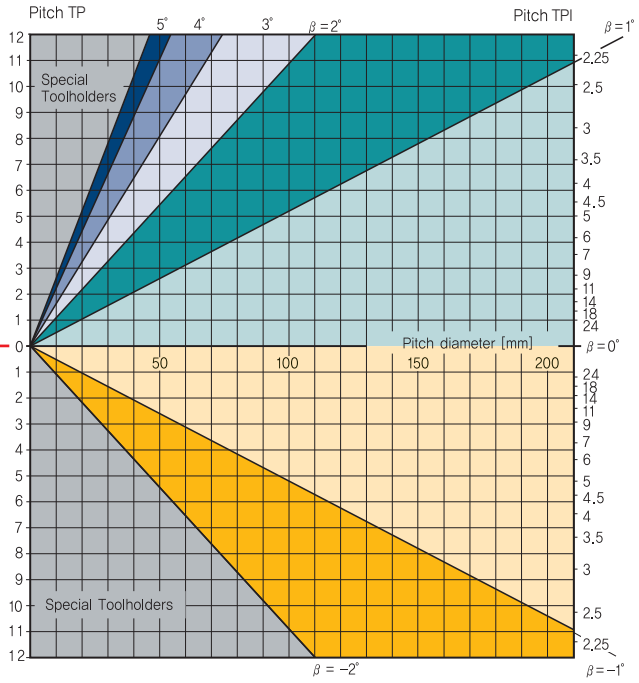
β : Helix angle (°)
P: Pitch (mm)
N: No. of starts
D: Pitch diameter (mm)
Lead = TP × N

- The helix angle can also be found from the diagram below

(Helix angle diagram)



The dimension HF (cutting edge height) remains constant with every insert/shim combination

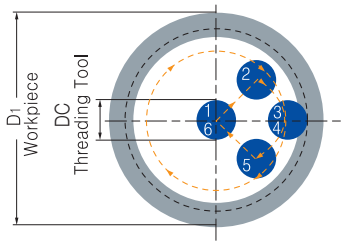


03) Useful cutting tip - **Thread Milling**

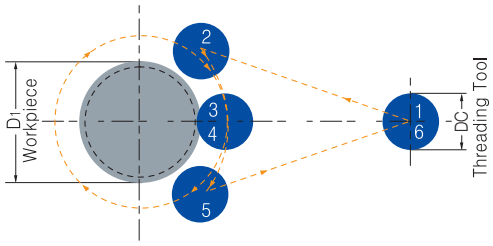
Tangential Arc Approach

- With this method, the tool enters and exits the workpiece smoothly. No marks are left on the workpiece and there is no vibration, even with harder materials. Although it requires slightly more complex programming than the radial approach (see below), this is the method recommended for machining the highest quality threads

Internal thread



External thread



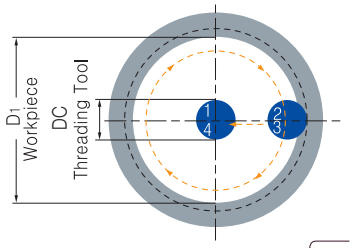
1-2 : Rapid approach
2-3 : Tool entry along tangential arc, with simultaneous feed along z-axis
3-4 : Helical movement during one full orbit (360°)
4-5 : Tool exit along tangential arc, with continuing feed along z-axis
5-6 : Rapid return

Radial Approach

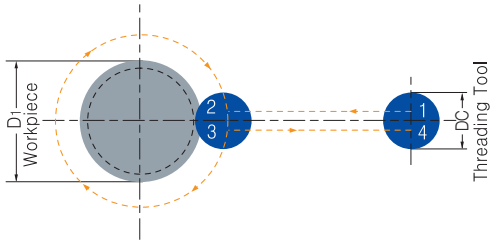
- This is the simplest method. There are two characteristics worth nothing about the radial approach:
  ① a small vertical mark may be lift at the entry (and exit) point. This is of no significance to the thread itself
  ② when using this method with very hard materials, there may be a tendency of the tool to vibrate as it approaches the full cutting depth

Note : Radial feed during entry to the full profile depth should only be 1/3 of the subsequent circular feed

Internal thread



External thread

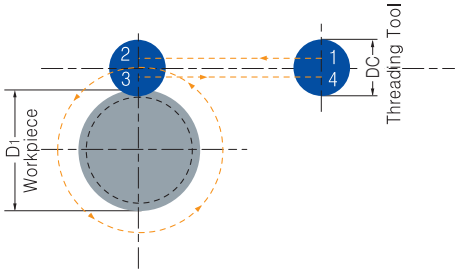


1-2 : Radial entry
2-3 : Helical movement during one full orbit (360°)
3-4 : Radial exit

Tangential Line Approach

- This method is very simple, and has all of the advantages of the tangential arc method However, it is applicable only with external threads

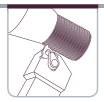
External thread



1-2 : Radial entry with simultaneous feed along z axis
2-3 : Helical movement during one full orbit (360°)
3-4 : Radial exit

04) Troubles in cutting and solutions - Thread Turning

Problem		Possible cause	Solution
	**Increased flank wear**	Too high cutting speed	Reduce cutting speed/use coated insert
		Too low depth of cut / Too many passes	Increase the depth of cut per pass
		Unsuitable carbide grade	Use a coated carbide grade
		Insufficient coolant oil	Increase coolant flow rate
	**Uneven cutting edge wear**	Incorrect helix angle	Choose the correct shim
		Wrong infeed method	Use the alternating flank infeed method
	**Extreme plastic deformation**	Too deep depth of cut	Decrease depth of cut/ increase number of passes
		Insufficient coolant	Increase coolant flow rate
		Too high cutting speed	Reduce cutting speed
		Unsuitable carbide grade	Use a tougher carbide
		Too small nose radius	Use an insert with a larger radius, if possible
	**Cutting edge breakage**	Too deep depth of cut	Decrease depth of cut/ increase number of passes
		Extreme plastic deformation	Use a tougher carbide
		Insufficient coolant oil	Increase flow rate and/ or correct flow direction
		Unsuitable carbide grade	Use a tougher carbide
		Instability	Check stability of the system
	**Built-up edge**	Incorrect cutting speed	Change the cutting speed
		Unsuitable carbide grade	Use a coated carbide
	**Thread profile is too shallow**	Tool's height is not matched with the workpiece's axial height	Change tool's height
		Thread's crest is not properly shaped	Recheck the workpiece diameter
		Worn insert	Change the insert's cutting edge immediately
	**Poor surface quality**	Too low cutting speed	Increase cutting speed
		Wrong shim	Choose correct shim
		Flank infeed method is not appropriate	Use the alternate flank or radial infeed method



04) Troubles in cutting and solutions - **Thread Milling**

Problem		Possible cause	Solution
	**Excessive flank wear**	Too high cutting speed	Reduce cutting speed/use coated insert
		Chip is too thin	Increase feed rate
		Insufficient coolant	Increase coolant flow rate
	**Excessive chipping**	Chip is too thick	Reduce feed rate/Use the tangential arc method Increase RPM
		Vibration	Check stability
	**Built up edge**	Incorrect cutting speed	Change cutting speed
		Unsuitable carbide grade	Use a coated carbide grade
	**Chatter/ vibration**	Feed rate is too high	Reduce the feed.
		Profile is too deep	Execute two passes, each with increased cutting depth/ Execute two passes, each cutting only half the thread length
		Thread length is too long	Execute two passes, each cutting only half the thread length
	**Insufficient thread accuracy**	Tool deflection	Reduce feed rate/Execute a “zero” cut

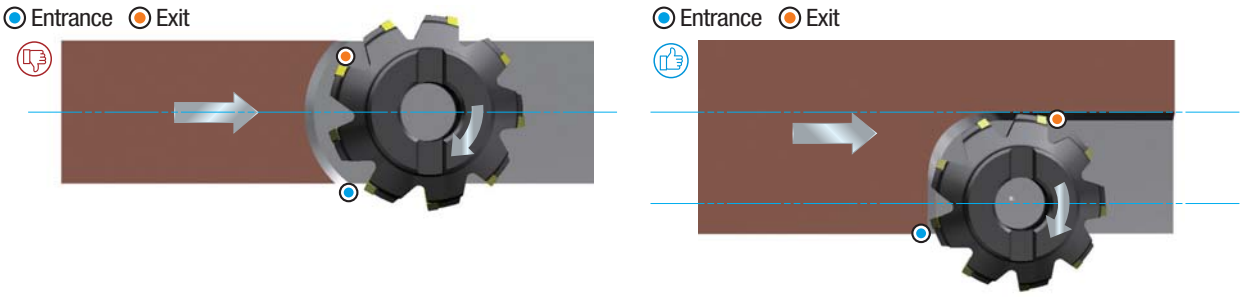
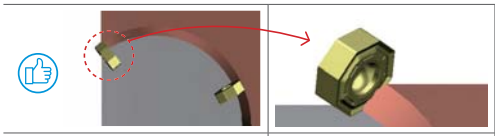
04) Useful cutting Tip

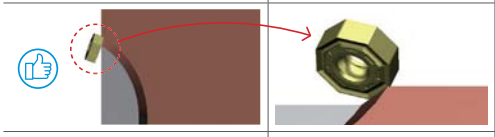
Cutter position : Do not align the cutter center with the center of the workpiece!



Optimal ae Selection : Maximize tool life by selecting the optimal ae!



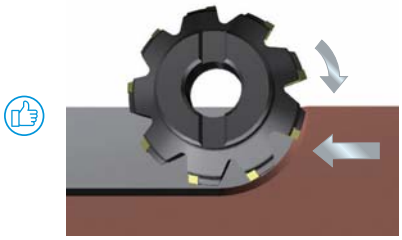
ae > 75% of ØD
- Optimal cutting conditions
- Offset the initial impact along the direction of rotation when entering the cut



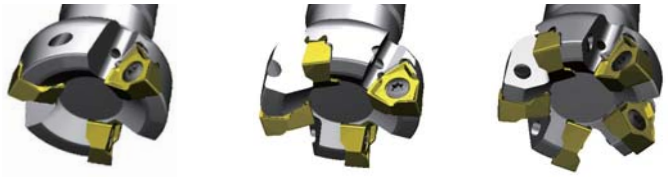
ae < 25% of ØD
- Form positively when entering.
- Absorb the impact during entry by the outermost part of the insert, gradually offset by the tool

ae = 50% of ØD
- Not recommended.
- Very high impact and load on the tool during a tool's entering

Downward milling : Reduce heat and minimize work hardening tendencies!



Optimal no. of tooth determination : Select the appropriate No. of tooth based on the application!

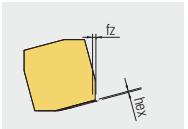


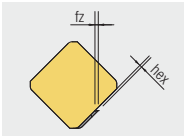
No sign (Coarse)
- Minimal no. of inserts
- Limited stability
- Long overhang
- Small machine/ limited power
- Deep pocket slot machining
- Uneven pitch

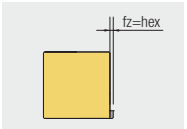
M (Close)
- General use
- Proper for multi-variety production
- Small to medium machine
- 1st recommended in general

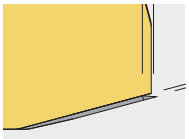
H (Extra Close)
- Maximal no. of inserts to maximize productivity
- Stable cutting conditions
- Short chip material
- Heat-resistant alloy material

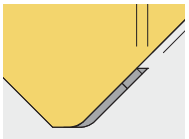
Optimal feed rate determination : Chip thickness varies upon the tool's approach angle so maximum feed rate also varies.

15°	45°	95°
		
				










$5.76 \times f_z$	$1.414 \times f_z$	f_z

→ **Main formula**

$$h_{ex} = f_z * \cos(AA)$$

$$f_z = \frac{h_{ex}}{\cos(AA)}$$

05 Troubles in cutting and solutions

	Excessive wear	Chipping / fracture	Wrong chip evacuation (chip jamming)	Built-up edge / welding
Troubles				Factors	• Excessive cutting speed/ excessive feed • Dull cutting edge • Low precision of tools	• Excessive feed • Weak jig • Long overhang	• Fracture on the corner • Chipping on the cutting edge and fracture • Re-cutting of chips	• Low cutting speed/ low feed • Negative shape • High adhesiveness material
Solutions	Cutting speed down, feed down 	Accurate clamping of workpiece 	Use more coolant and increase its pressure 	Check the cutting conditions 	Use higher grade 	Feed down 	Multiple pass division of deep machining 	Cutting speed up, feed up 	Applying C/B for low cutting load 	Use lower grade 	Upward cutting 	Positive I/S, Using polished inserts 	Use high precision class inserts (higher tolerance) 	Applying a C/B for strong cutting edge 	Applying fewer teeth (pitches) 	Use more coolant and increase its pressure

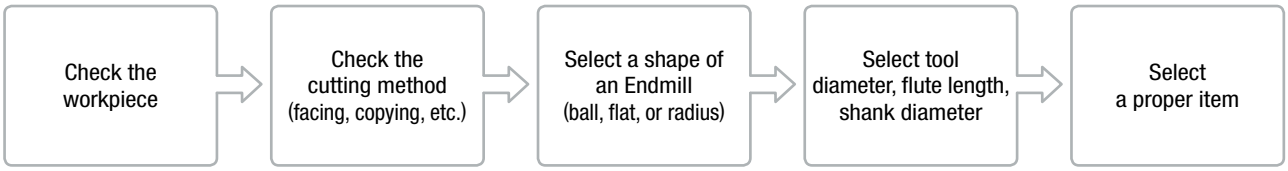
Ball	2 teeth					★		★	
	4 teeth					☆		★	

※ It is recommended to choose the shortest length tool in every application as possible.
※ Stable machining actualizes long tool life and enhanced surface finish.

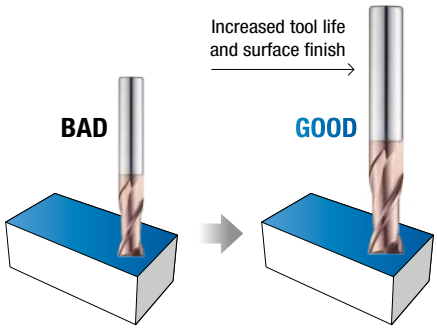
03 Useful cutting tip

How to select an Endmill

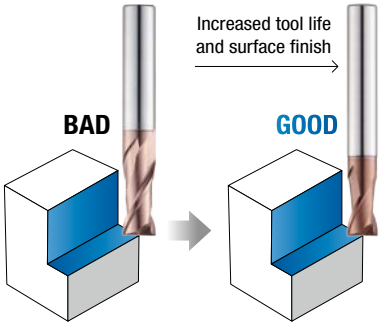


How to use an Endmill

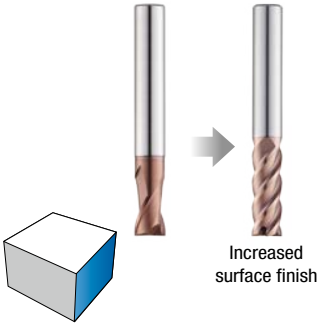
1) Using a larger diameter in case of no issues during machining



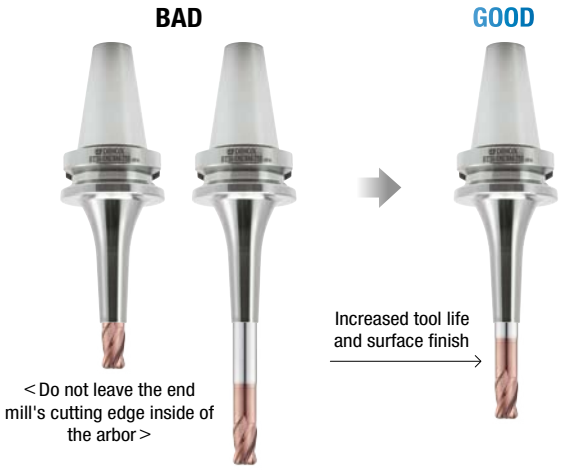
2) Use the shortest available flute length



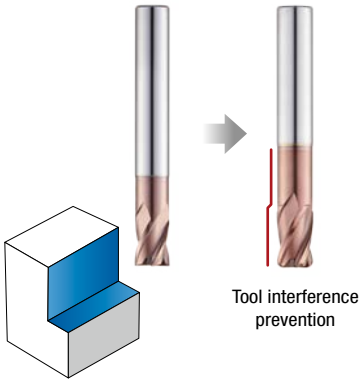
3) Use a tool with more flutes as possible for finishing



4) Maintain a short end mill overhang from arbor



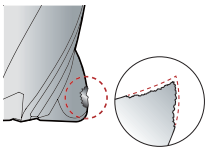
5) Use a necked tool for deep machining depths

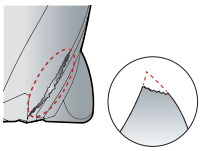


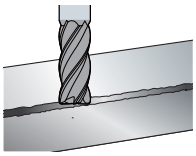
※ In case you already have existing tools in use

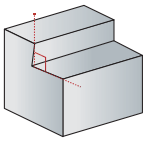
Please install the KORLOY KTS app from Play Store or App store and utilize the Solid Tool Converter to select recommended tools. [App Store Link]

04) Troubles in cutting and solutions

Troubles	Chipping on the tool	Excessive wear on the tool	Bad surface finish	Defective dimensional accuracy, perpendicularity	Fracture in while cutting
					








Factors	• High speed / high feed • Long flute length, overhang	• High speed / high feed • Long overhang	• Vibration • Built-up edge	• Improper cutting conditions • Long flute length, overhang	• Improper cutting conditions • Long overhang
Solutions	Cutting speed down, feed down 	Cutting speed down, feed down 	Cutting speed up, feed down 	Cutting speed up, feed down 	Cutting speed down, feed down 	Use a tool with short flute length 	Check the item (shape and grade) 	Select short overhang 	Use a tool with short flute length 	Enlarge the space for chip flowing (Decrease the no. of tooth) 	Select short overhang 	Increase the no. of effective tooth 	Use a tool with short flute length 	Increase the no. of effective tooth 	Select short overhang 	Check the item (shape and grade) 	Select short overhang 	Check the clamping of the facility, arbor and workpiece 	Select short overhang 	Check the item (shape and grade)

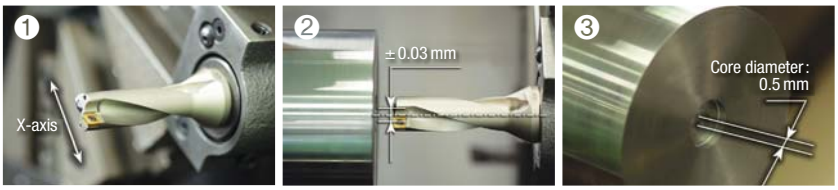
03 Useful cutting tip

Notice for setting the drill in the lathe

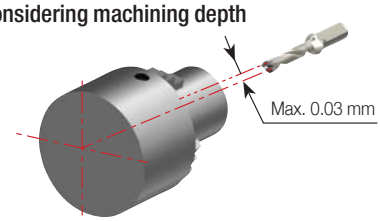


- Set the peripheral insert parallel to the X axis (based on the side lock)
- If the machined core is about 0.5 mm after machining 5 mm, that is the proper setting

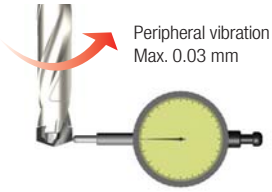
※ Please make sure that the location of the side lock could be different depending on manufacturers of machine

Notice for setting the top solid indexable drill

Use the shortest drill as possible after considering machining depth



[Setting of the horizontal equipment]

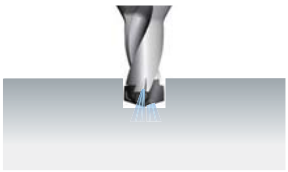


[Setting of the vertical equipment]

How to drill a deep hole (10D/12D)

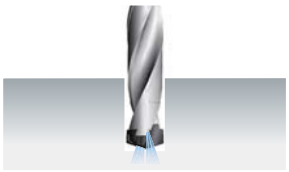
Using a pilot drill (Recommended)

1. Drilling a pilot hole (with a pilot drill)



- Drill a 0.5D pilot hole in 70% lower cutting speed with 1.5D drill or 3D drill

2. Start drilling



- Start drilling in recommended cutting conditions after replacing the drill

Without pilot drill

1. Drilling a pilot hole (without a pilot drill)

- After drill 0.5D with 70% lower cutting speed, stop drilling for 2-3 seconds putting the drill in the hole

2. Stop drilling

- Stop supplying the coolant and completely take out the drill from the hole. Then, stop drilling for 2-3 seconds

3. Ready to drill

- After putting the drill in the hole to 2-3 mm upper than the bottom of the pilot hole, start supplying the coolant. Then, be ready to start drilling

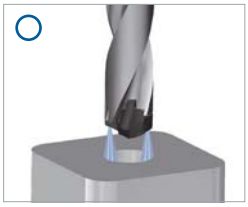
4. Stop drilling

- Start drilling in recommended cutting conditions

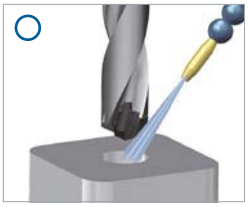
Cautions when drilling

- Supply enough coolant to the beginning of the hole
- Minimum pressure of oil coolant : 5 bar
- Minimum flow of coolant : 1.321 gal/min

[Internal coolant]



[External coolant]



[Non-dry processing]

04) Troubles in cutting and solutions

	Wrong hole size : Both shrunken or enlarged	**Chattering in cutting**	**Wrong chip evacuation** (chip jamming)	**Bad surface finish of hole**	**Short tool life of insert**
Troubles					Factors	• Wrong setting • Lack of coolant	• Long overhang • Weak jig	• Fracture of corner • Lack of coolant	• Lack of coolant • Weak jig	• High speed / high feed • Weak jig
Solutions	Check the status of drill run-out 	Select short overhang 	Check the item (shape and grade) 	Use more coolant and increase its pressure 	Check the cutting conditions 	Accurate clamping of workpiece 	Accurate clamping of workpiece 	Use more coolant and increase its pressure 	Accurate clamping of workpiece 	Accurate clamping of workpiece 	Use more coolant and increase its pressure 	Check the clamping of the facility, arbor and workpiece 	Cutting speed up, feed down 	Select short overhang 	Use more coolant and increase its pressure 	Cutting speed up, feed down 	Cutting speed down, feed down 	Select short overhang 	Cutting speed up, feed down 	Check the item (shape and grade)

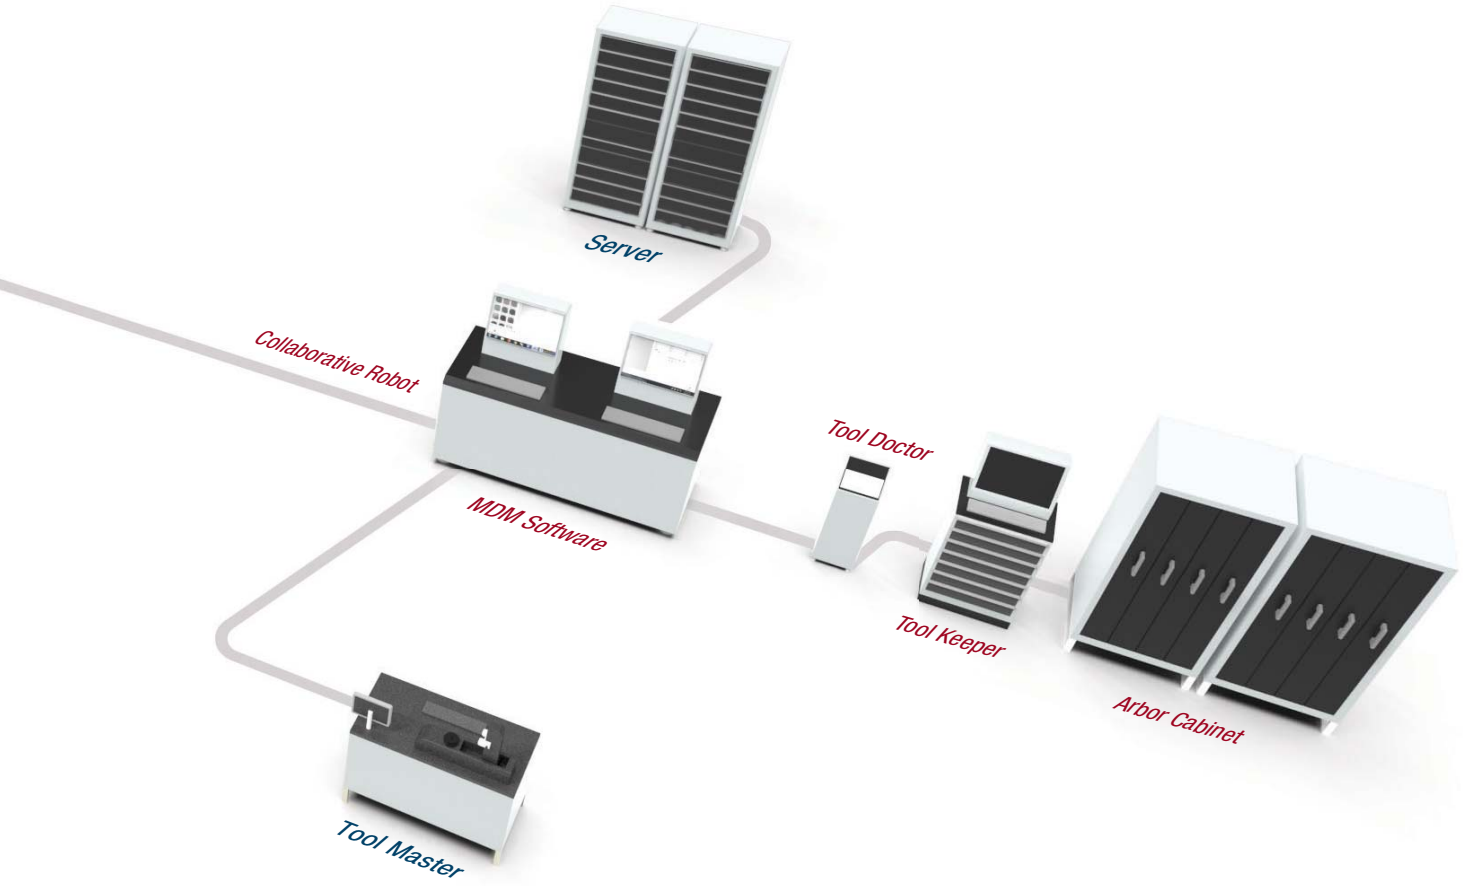
Collaborative Robot	Tool Master (Tool pre-setter)	MDM (Tool management S/W)
• Optimal for repeated work in small place • Effective on works with heavy weight materials	• Measuring the offset of tool length in advance • Reduced tool setting time and downtime	• Managing the tool holder information → Cutting diameter, overall length, storage location • Integrated management of tool, production, CAM, etc.



Tool Doctor (Monitoring system)	Tool Keeper (Tool management equipment)	Arbor Cabinet (Storage box exclusive for Arbors)
• Managing poor quality product manufacturing in mass production → Tool breakage, unprocessed item check, and re-processing • Managing tool life trends	• Managing tool releases day and night • Systemic management of stock and inventory backup order • Transparent tool usage results management	• Enhancing space efficiency and protecting tools (from damage or pollution of tools due to debris of work sites) • Capable for running virtual warehouse with Tool Keeper (Managing position and quantity of tools)

⚠ For the safe metalcutting

- Use safety supplies such as protective gloves to prevent possible injury while touching the edge of tools.
- Use safety glasses or safety cover to hedge possible dangers. Inappropriate usage or excessive cutting condition may lead tool's breakage or even the fragment's scattering.
- Clamp the workpiece tightly enough to prevent its movement while its machining.
- Properly manage the tool change phase because the inordinately used tool can be easily broken under the excessive cutting load or severe wear, and it may threat the operator's safety.
- Use safety cover because chips evacuated during cutting are hot and sharp and may cause burns and cuts. To remove chips safely, stop machining, put on protective gloves, and use a hook or other tools.
- Prepare for fire prevention measures as the use of the non-water soluble cutting oil may cause fire.
- Use safety cover and other safety supplies because the spare parts or the inserts can be pulled out due to centrifugal force while high speed machining.
